

**TITLE OF INVENTION: BRACKET AND METHOD OF ATTACHING UPPER
BEAM OF WINDOW BLIND TO THE BRACKET**

ABSTRACT

A bracket, which is adapted for attachment of an upper beam of a window blind having opposite first and second walls provided with first and second linked portions respectively, includes a supporting plate and an abutting plate connected thereto. The supporting plate has a first buckling portion and a guiding sheet separate therefrom. The abutting plate has a second buckling portion. When the upper beam is attached to the bracket, the first linked portion of the upper beam is abutted on the guiding sheet of the supporting plate and embedded in the first buckling portion of the supporting plate, the second wall of the upper beam is abutted on the abutting plate, and the second linked portion of the upper beam is embedded in the second buckling portion of the abutting plate. Besides, the present invention provides a method of attaching the upper beam to the bracket.
