

METHOD AND APPARATUS FOR AUTHORIZED LOGIN

ABSTRACT

The present application provides a method for an authorized login. The method includes the following: zooming out a user interface of a first application in response to a zooming operation for the user interface of the first application; displaying an icon of at least one second application that a user has logged in to in a blank area generated after the user interface of the first application is zoomed out, where the first application pre-establishes an association with the second application; transmitting login authorization information of the second application to the first application in response to an operation of dragging the icon of the second application from the blank area to the zoomed-out user interface of the first application, so that the first application submits the login authorization information of the second application to a server of the second application by using a server of the first application for login authorization verification; and performing an authorized login to the first application in response to a notification message that is returned by the server of the second application through the server of the first application, where the notification message indicates that the login authorization information is verified. The present application can reduce the operation complexity in performing an authorized login.
