

RECOVERY DEVICE FOR RETRIEVING A CORD, A RECEIVING DEVICE
AND A METHOD FOR THE SAME

ABSTRACT

5

According to embodiments, a recovery device for retrieving a cord having one end portion coupled to a receiving device is provided. The recovery device includes a coupling component having an opening configured to accommodate a portion of the cord for movement of the coupling component along the cord, wherein at least a portion of the
10 coupling component is adapted for magnetically coupling to at least a portion of the receiving device, and further includes a retrieving arrangement configured to facilitate movement of the coupling component in a direction toward an opposite end portion of the cord. According to further embodiments, a receiving device for receiving a recovery device is also provided. The receiving device includes a central core adapted for
15 magnetically coupling to a portion of the recovery device; and a padding arrangement encasing at least part of the central core. A method of retrieving a cord is also described.
