

STORAGE

ABSTRACT

A storage includes: a storage chamber that
5 stores goods; a partition configured to move back
and forth in a direction along an inner wall of the
storage chamber, and divide the storage chamber into
multiple rooms; and a temperature adjustment device
configured to move back and forth in the direction
10 along the inner wall of the storage chamber, and
adjust the multiple rooms to different temperatures.
For example, in conjunction with the movement of the
partition, the temperature adjustment device moves
in the above direction. The partition is configured
15 to move back and forth between a first position, at
which the partition is stored along the inner wall,
and a second position, at which the partition
divides the storage chamber into the multiple rooms,
and the temperature adjustment device moves in that
20 direction in conjunction with the movement of the
partition between the first position and the second
position.
