Abstract

A method for accessing a network, performed by a terminal, includes determining a terminal parameter; and determining a signal threshold value corresponding to the terminal parameter based on the terminal parameter. A method for accessing a network, performed by a network side device, includes determining at least one candidate signal threshold value, and the at least one at least one candidate signal threshold value is associated with a terminal parameter.

~~The present disclosure relates to a cell reselection method, a cell reselection apparatus, and a storage medium. The cell reselection method comprises: determining location information of a terminal, wherein the location information comprises at least one of the distance between the terminal and a cell, and a geographic location of the terminal; and performing cell reselection according to the location information. According to the present disclosure, it can be accurately determined that a terminal is located at the edge of a cell, so that cell reselection can be performed in a timely manner.~~
