CLAIMS

I claim:

1. An apparatus for holding a product comprising:

a) a humidor;

b) a pusher mechanism located within said humidor, said pusher mechanism having a width adjustable channel; and

c) a plurality of cigar tubos located within said channel,

wherein said pusher mechanism further comprises a first side member and a second side member, with a space between said first side member and said second side member defining said channel, said first side member and said second side member each comprise a least one ridge and at least one groove, said ridge of said first side member being engaged with said groove of said second side member, and said ridge of said second side member being engaged with said groove of said first side member.

2. The apparatus for holding a product of claim 1 wherein said pusher mechanism further comprises a channel width adjustment mechanism.

3. The apparatus for holding a product of claim 1 wherein said first side member comprises a slit and said second side member comprises a pin, said pin being slidably engaged with said slit.

4. The apparatus for holding a product of claim 3, wherein said slit further comprises a slit end, such that a contact of said pin with said slit end provides a limit to a width of which said channel is capable of being adjusted.

5. The apparatus for holding a product of claim 1 wherein said first side member comprises a first guide rib, and said second side member comprises a second guide rib.

6. The apparatus for holding a product of claim 1 wherein said pusher mechanism further comprises a track, said track extending along a length of said channel.

7. The apparatus for holding a product of claim 6 further comprising a ramp at an end of said track.

8. The apparatus for holding a product of claim 6 further comprising a pusher tab, said pusher tab being slidably engaged with said track.

9. The apparatus for holding a product of claim 8 further comprising a variable force coil spring, said variable force coil spring being engaged with said pusher tab.

10. The apparatus for holding a product of claim 9 wherein said variable force coil spring biases said plurality of cigar tubos towards an end of said track.

11. The apparatus for holding a product of claim 10 wherein a force exerted by said variable force coil spring on said pusher tab decreases as said pusher tab moves towards said end of said track.

12. The apparatus for holding a product of claim 1 wherein said plurality of cigar tubos are oriented vertically in said channel.

13. The apparatus for holding a product of claim 12 wherein said plurality of cigar tubos are oriented in a substantially strait line in said channel.

14. An apparatus for holding a product comprising:

a) a humidor; and

b) a pusher mechanism located within said humidor, said pusher mechanism having a channel, said channel being configured to hold a plurality of cigar tubos,

wherein said pusher mechanism further comprises a first side member having a first guide rib, and a second side member having a second side rib

15. The apparatus for holding a product of claim 14, wherein a width of said channel is adjustable.
