(54) Title: A TRANSPORTATION FRAME

FIG. 1A

(57) Abstract: A transportation frame for holding a plurality of items together, said transportation frame including: at least two frame members, including a first frame member and a second frame member, connectable together to form the transportation frame, each frame member including a pair of opposed ends; and at least a pair of locking arrangements for releasable securing the frame members together at adjacent ends to permit the first frame member to be selectively locked and unlocked relative to the second frame member so that the first frame member can be selectively detached and re-attached relative to the second frame member, each locking arrangement including: at least two leg formations operatively associated with ends of the first frame member, at least one leg formation orientated in a transverse direction to at least one other leg formation; a receiving opening defined at an end of the second frame member and configured to at least partially receive a leg formation for attachment and orientation of the first frame member relative to the second
