ABSTRACT

5 An arm (17A, 17B, 17C) for an elastic doll capable of
preventing torsional rotation of a core (10) in a molding
material molded. The elastic doll arm includes the core (10)
made of metal and arranged therein. The metal core (10) is
provided on a distal end thereof or a portion thereof positioned
in proximity to the distal end with a spacer (13) having a
sectional area smaller than that of the arm. A material for the
spacer (13) and the molding material for the arm are compatible
10 with each other, resulting in the spacer (13) being integrated
with the molding material.
