

ABSTRACT OF THE DISCLOSURE

A two way selective call receiver (1) comprising a
5 combined transmitter and receiver circuit (2), for
receiving a coded transmitted message, and a processor (3)
for determining if the message is a preview message of a
longer message. The selective call receiver (1) also
comprises a memory 4, display (5) and keypad (6). Upon
10 receipt of a signal from the keypad (6), the processor (3)
provides an encoded request signal to transmitter and
receiver circuit. The request signal is used to request,
from an information system, the longer message associated
with the preview message.
