

Abstract

The present disclosure relates to an interference information reporting method and apparatus, and a frequency range determination method and apparatus. The interference information reporting method comprises: determining a condition which satisfies the transmission of interference information; and transmitting the interference information to a network device, wherein the interference information comprises information of a frequency range involved in a frequency interference problem. According to the present disclosure, since a terminal reports the information in the interference information containing the frequency range involved in the frequency interference problem to the network device, as opposed to the reported interference information only comprising a center frequency point, the network device can accurately determine the frequency range at which interference occurs, so that the network device can accurately solve the frequency interference problem.
