

IMPROVED COLLAPSIBLE BOAT

ABSTRACT OF THE DISCLOSURE

5           A boat having bottom and side panels. A  
yieldable diaphragm has a seal between the diaphragm and  
the panels. A motor mount on a rear seat board projects  
rearwardly and beyond the diaphragm to present a support  
for a motor. A sailboat has a rudder controlled by a  
10 tiller. Another motor mount is rotatably mounted on the  
sides of the boat so that it serves as a seat or a  
mounting panel for a boat. A diaphragm can be placed on  
the bottom of the boat and then shifted rearwardly so  
that tongues or projections of rubber on the bottom and  
15 sides of the diaphragm can be moved rearwardly and  
received in sealing relationship with forwardly facing,  
open end slots on the bottom and side panels of the boat.
