

TITLE

ORDER PRINTING METHOD AND SYSTEM, AND STORAGE MEDIUM

ABSTRACT

Embodiments of this specification provide an order printing method and system, and a storage medium. In the method, a POS device receives a plurality of orders from a plurality of platforms, and generates to-be-printed content corresponding to the target material based on order content of the target order. Then, the POS device sends the to-be-printed content to a printing device by using a digital image, so that the printing device prints the digital image. An instruction set of the printing device is not specifically adapted to instruction sets of all the plurality of platforms.
