

ACCESS CONTROL DEVICE, COMMUNICATION SYSTEM, PROGRAM,
AND METHOD FOR CONTROLLING ACCESS

ABSTRACT

An access control device for controlling an access by a communication terminal to an application
5 includes an authentication method management means configured to manage each of the application in association with authentication information, which indicates an effective authentication method effective for authenticating an access request source of an access
10 request to access the application, an authenticating means configured to authenticate the access request source using a usable authentication method, which can be used in the communication terminal, based on the access request, an access request receiving means configured to receive the
15 access request to access an intended application from the communication terminal, and an access control means configured to control the communication terminal so that the communication terminal does not access the intended application in a case where the authentication method
20 management means does not manage the authentication information, which indicates the authentication method used for the authentication, and on the other hand the communication terminal accesses the intended application in a case where the authentication method management means
25 manages the authentication information.
