ABSTRACT

A lancet of which distal end portion of a puncturing member does not easily bend, when a weakened portion 22 between a lancet body and a cap is broken, is provided.

The lancet 100 comprises the lancet body 102 having the distal end portion of the puncturing member protruding from the front end portion thereof and the cap 104 that houses and protects the distal end portion of the puncturing member that protrudes before use, wherein the front end portion 112 of the lancet body and the rear end portion 110 of the cap are integrated in substantially adjoining state with each other via the weakened portion 114; one of the end face 120 at the front end portion of the lancet body and the end face 122 at the rear end portion of the cap that opposes the former has protrusions 126, and the top end 128 of the protrusion defines the imaginary plane 132 that extends perpendicularly to the longitudinal direction of the puncturing member; and the other end face defines the flat surface that extends perpendicularly to the longitudinal direction of the puncturing member.
