

Abstract

The invention relates to an escalator (1) or a moving walkway with at least one interior space (19), which is delimited relative to the environment of the escalator (1) or the moving walkway by at least one cladding component (23, 27, 28, 33, 34, 35). The cladding component (23, ..., 35) comprises at least one multi-layer composite steel plate (40), wherein the composite steel plate (40) comprises at least one load-bearing layer (42) of low-alloy steel and at least one cover layer (41) of corrosion-resistant steel. The at least one cover layer (41) is arranged at one of the two side surfaces (43, 44) of the composite steel plate (40). The at least one cover layer (41) of the cladding component (23, ..., 35), which is mounted on the escalator (1) or moving walkway, is oriented towards the environment.
