

METHODS OF DOSING AND TREATMENT WITH A TACI-FC FUSION IMMUNOMODULATORY PROTEIN

Cross-Reference to Related Applications

[0001] This application claims priority from U.S. Provisional Application No. 63/186,027 filed May 7, 2021, U.S. Provisional Application No. 63/239,899, filed September 1, 2021, U.S. Provisional Application No. 63/256,505, filed October 15, 2021, U.S. Provisional Application No. 63/278,072, filed November 10, 2021, and U.S. Provisional Application No. 63/329,325, filed April 8, 2022, the contents of each of which are hereby incorporated by reference in their entirety.

Incorporation by Reference of Sequence Listing

[0002] The present application is being filed along with a Sequence Listing in electronic format. The Sequence Listing is provided as a file entitled 761612003940SeqList.TXT, created May 4, 2022 which is 284,174 bytes in size. The information in the electronic format of the Sequence Listing is incorporated by reference in its entirety.

Field

[0003] The present disclosure provides methods of treatment and uses involving an immunomodulatory TACI-Fc fusion protein that exhibits neutralizing activity of BAFF and APRIL (or BAFF/APRIL heterotrimers). The provided TACI-Fc fusion protein may include variant domains of Transmembrane Activator and CAML Interactor (TACI). The methods and uses provide therapeutic utility for a variety of immunological diseases, disorders or conditions, such as B cell-mediated diseases, disorder or conditions.

Background

[0004] Modulation of the immune response by intervening in processes involving interactions between soluble ligands and their receptors is of increasing medical interest. Currently, biologics used to enhance or suppress immune responses have generally been limited to antibodies (e.g., anti-PD-1 antibodies) or soluble receptors against a single cell surface molecule (e.g., CTLA-4-Fc). Improved therapeutic agents that can modulate the immune

response, and particularly B cell immune responses, are needed. Provided are embodiments that meet such needs.

Summary

[0005] Provided herein are methods of treating an inflammatory or autoimmune disease or disorder in a subject in need thereof by administering to the subject any of the provided TACI-Fc fusion proteins as described herein, in which the TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide as described herein, and wherein the TACI-Fc fusion protein is administered at a dose of from at or about 2.4 mg to at or about 960 mg once every week up to once every three months.

[0006] Also provided herein are uses that include uses of a pharmaceutical composition containing any of the provided TACI-Fc fusion proteins as described herein, in which the TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide as described herein, and in the preparation of a medicament in order to carry out such therapeutic methods for treating an inflammatory or autoimmune disease or disorder. In some embodiments, also provided herein are pharmaceutical compositions for use for treating an inflammatory or autoimmune disease or disorder in a subject in which with the pharmaceutical composition contains any of the provided TACI-Fc fusion proteins as described herein, in which the TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide as described herein. In some embodiments, the use or pharmaceutical compositions for use are for administering to a subject the TACI-Fc fusion protein at a dose of from at or about 2.4 mg to at or about 960 mg once every week up to once every three months.

[0007] In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 8 mg to 960 mg. In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 80 mg to 960 mg.

[0008] In some embodiments, the variant TACI polypeptide of the TACI-Fc fusion is a portion of the extracellular domain composed of the CRD2 TNF receptor domain set forth in SEQ ID NO:13 in which is present amino acid substitutions K77E, F78Y and Y102D. In some embodiments, the variant TACI is set forth in SEQ ID NO:26. In embodiments of any of the described TACI-Fc fusion proteins, the variant TACI is linked to the Fc domain via the linker.

[0009] Provided herein are methods of treating an inflammatory or autoimmune disease or disorder in a subject in need thereof by administering to the subject a TACI-Fc fusion protein that is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D in the amino acid sequence set forth in SEQ ID NO:13, wherein the TACI-Fc fusion protein is administered at a dose of from at or about 2.4 mg to at or about 960mg once every week up to once every three months.

[0009a] Disclosed herein is a TACI-Fc fusion protein or a formulation comprising thereof, for use in treating an inflammatory or autoimmune disease or disorder in a subject in need thereof, wherein TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D in the amino acid sequence set forth in SEQ ID NO:13, wherein the TACI-Fc fusion protein is to be administered at a dose of from at or about 2.4 mg to at or about 960 mg once every week up to once every three months.

[0009b] Disclosed herein is the use of a TACI-Fc fusion protein in the preparation of a medicament for treating an inflammatory or autoimmune disease or disorder in a human subject, wherein TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D with reference to the amino acid sequence set forth in SEQ ID NO:13, wherein the amino acid position numbering corresponds to that of SEQ ID NO: 122, wherein the TACI-Fc fusion protein is to be administered at a dose of from 8 mg to 960 mg once every week up to once every three months.

[0010] Also provided herein are uses that include uses of a pharmaceutical composition containing any of the provided TACI-Fc fusion proteins as described herein, in which the TACI-Fc fusion protein is a TACI-Fc fusion protein that is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D in the amino acid sequence set forth in SEQ ID NO:13, and in the preparation of a medicament in order to carry out such therapeutic methods for treating an inflammatory or autoimmune disease or disorder. In some embodiments, also provided herein are pharmaceutical compositions for use for treating an inflammatory or autoimmune disease or disorder in a subject in which with the pharmaceutical composition contains a TACI-Fc fusion protein that is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid

substitutions K77E, F78Y and Y102D in the amino acid sequence set forth in SEQ ID NO:13. In some embodiments, the use or pharmaceutical compositions for use are for administering to a subject the TACI-Fc fusion protein at a dose of from at or about 2.4 mg to at or about 960mg once every week up to once every three months.

[0011] In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 8 mg to 960 mg. In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 80 mg to 960 mg. Provided herein are methods of treating an inflammatory or autoimmune disease or disorder in a subject in need of treatment by administering to the subject a TACI-Fc fusion protein that is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein the TACI-Fc fusion protein is administered at a dose of from at or about 2.4 mg to at or about 960 mg once every week up to once every three months. In some embodiments, the TACI is any one of the TACI polypeptides described herein, such as any one of the variant TACI polypeptides described herein, the linker is any linker as described herein, and the Fc is any Fc region described herein.

[0012] Provided herein are methods of treating an inflammatory or autoimmune disease or disorder in a subject in need of treatment by administering to the subject a TACI-Fc fusion protein that is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein the TACI-Fc fusion protein is administered at a dose of from at or about 8 mg to at or about 960 mg once every week up to once every three months. In some embodiments, the TACI is any one of the TACI polypeptides described herein, such as any one of the variant TACI polypeptides described herein, the linker is any linker as described herein, and the Fc is any Fc region described herein.

[0013] In one aspect, provided herein is a method of treating an inflammatory or autoimmune disease or disorder in a subject in need thereof, the method comprising administering to the subject a TACI-Fc fusion protein that is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D in the amino acid sequence set forth in SEQ ID NO:13, wherein the TACI-Fc fusion protein is administered at a dose of from at or about 8 mg to at or about 960 mg once every week up to once every three months.

[0014] Also provided herein are uses of any of the provided TACI-Fc fusions proteins as described. Uses include pharmaceutical compositions comprising the TACI-Fc fusion protein for use in any of such provided methods, and in the preparation of a medicament in order to carry out any of such provided methods.

[0015] In embodiments of any of the provided methods or uses, the dose of the TACI-Fc fusion protein is administered once every three months. In embodiments of any of the provided methods or uses, the dose of the TACI-Fc fusion protein is administered once every month (Q4W). In embodiments of any of the provided methods or uses, the dose of the TACI-Fc fusion protein is administered once every other week (Q2W). In embodiments of any of the provided methods or uses, the dose of the TACI-Fc fusion protein is administered once a week (Q1W).

[0016] In embodiments of any of the provided methods or uses the TACI-Fc fusion protein is administered at a dose of from at or about 80 mg to at or about 720 mg, from at or about 160 mg to at or about 560 mg or from at or about 240 mg to at or about 480 mg. In embodiments of any of the provided methods or uses, the TACI-Fc fusion protein is administered at a dose of from at or about 40 mg to at or about 480 mg, from at or about 80 mg to at or about 320 mg, or from at or at or about 80 mg to at or about 120 mg.

[0017] In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 80 mg to at or about 720 mg. In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 160 mg to at or about 560 mg. In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 240 mg to at or about 480 mg.

[0018] In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 24 mg to at or about 480 mg.

[0019] In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 40 mg to at or about 480 mg. In some embodiments, the dose of the TACI-Fc fusion protein is from at or about 80 mg to at or about 320 mg. In some embodiments, the dose of the TACI-Fc fusion protein is from at or at or about 80 mg to at or about 120 mg.

[0020] In embodiments of any of the provided methods or uses, the TACI-Fc fusion protein is administered at a dose of from at or about 240 mg to from at or about 480 mg once. In embodiments of any of the provided methods or uses, the TACI-Fc fusion is administered at a dose from at or about 80 mg to at or about 120 mg.

[0021] In embodiments of any of the provided methods or uses, the administration is via intravenous administration.

[0022] In some embodiments, the dose of the TACI-Fc fusion protein for intravenous administration is at or about 2.4 mg. In some embodiments, the dose of the TACI-Fc fusion protein for intravenous administration is at or about 8 mg. In some embodiments, the dose of the TACI-Fc fusion protein for intravenous administration is at or about 24 mg. In some

embodiments, the dose of the TACI-Fc fusion protein for intravenous administration is at or about 80 mg. In some embodiments, the dose of the TACI-Fc fusion protein for intravenous administration is at or about 240 mg. In some embodiments, the dose of the TACI-Fc fusion protein for intravenous administration is at or about 480 mg. In some embodiments, the dose of the TACI-Fc fusion protein for intravenous administration is at or about 960 mg.

[0023] In embodiments of any of the provided methods or uses, the administration is via subcutaneous administration.

[0024] In some embodiments, the dose of the TACI-Fc fusion protein for subcutaneous administration is at or about 80 mg. In some embodiments, the dose of the TACI-Fc fusion protein for subcutaneous administration is at or about 240 mg. In some embodiments, the dose of the TACI-Fc fusion protein for subcutaneous administration is at or about 480 mg. In some embodiments, the dose of the TACI-Fc fusion protein for subcutaneous administration is at or about 960 mg.

[0025] In embodiments of any of the provided methods or uses, the variant TACI polypeptide in the TACI-Fc fusion protein is set forth in SEQ ID NO:26.

[0026] In embodiments of any of the provided methods or uses, the linker in the TACI-Fc fusion protein is selected from GSGGS (SEQ ID NO: 76), GGGGS (G4S; SEQ ID NO: 77), GSGGGGS (SEQ ID NO: 74), GGGGSGGGGS (2xGGGGS; SEQ ID NO: 78), GGGGSGGGGSGGGGS (3xGGGGS; SEQ ID NO: 79), GGGGSGGGGSGGGGSGGGGS (4xGGGGS, SEQ ID NO:84), GGGGSGGGGSGGGGSGGGGSGGGGS (5xGGGGS, SEQ ID NO: 91), GGGGSSA (SEQ ID NO: 80), or GSGGGGSGGGGS (SEQ ID NO:194) or combinations thereof. In embodiments of any of the provided methods or uses the linker is set forth in SEQ ID NO: 74.

[0027] In embodiments of any of the provided methods or uses, the Fc in the TACI-Fc fusion protein is an IgG1 Fc domain. In embodiments of any of the provided methods or uses, the Fc is a variant IgG1 Fc that exhibits reduced binding affinity to an Fc receptor and/or reduced effector function as compared to a wild-type IgG1 Fc domain. In some embodiments, the variant IgG1 Fc domain comprises one or more amino acid substitutions selected from L234A, L234V, L235A, L235E, G237A, S267K, R292C, N297G, and V302C, by EU numbering. In some embodiments, the variant IgG1 Fc comprises the amino acid substitutions L234A, L235E, and G237A by EU numbering.

[0028] In embodiments of any of the provides methods or uses the Fc comprises the amino acid substitution C220S, wherein the residues are numbered according to the EU index of Kabat.

In embodiments of any of the provided methods or uses, the Fc lacks the hinge sequence EPKSS or EPKSC. In the Fc region comprises K447del, wherein the residue is numbered according to the EU index of Kabat.

[0029] In embodiments of any of the provided methods or uses, the Fc comprises the amino acid sequence set forth in SEQ ID NO:73. In some of any of the provided methods or uses, the TACI-Fc fusion protein is set forth in SEQ ID NO: 167.

[0030] In embodiments of any of the provided methods or uses, the Fc comprises the amino acid sequence set forth in SEQ ID NO:81. In embodiments of any of the provided methods or uses, the TACI-Fc fusion protein is set forth in SEQ ID NO: 168.

[0031] In embodiments of any of the provided methods or uses, the administration is via intravenous administration. In embodiments of any of the provided methods or uses, the administration is via subcutaneous administration.

[0032] In embodiments of any of the provided methods or uses, a B cell immune response or activity is reduced in the subject. In embodiments of any of the provided methods or uses, the numbers of mature and total circulating B cells is reduced in the subject. In embodiments of any of the provided methods or uses, circulating serum immunoglobulins (IgG) are reduced in the subject. In embodiments of any of the provided methods or uses, one or more of B cell maturation, differentiation, and/or proliferation is reduced or inhibited. In embodiments of any of the provided methods or uses, circulating levels of an APRIL or BAFF protein are reduced in the subject, optionally wherein the APRIL or BAFF protein is a APRIL homotrimer, BAFF homotrimer, APRIL/BAFF heterotrimer, or BAFF 60mer.

[0033] In embodiments of any of the provided methods or uses, the disease or disorder is a B cell-mediated disease or disorder. In embodiments of any of the provided methods or uses, the disease or disorder is an autoimmune disease, and inflammatory condition, a B cell cancer, an antibody- mediated pathology, a renal disease, a graft rejection, graft versus host disease, or a viral infection.

[0034] In embodiments of any of the provided methods or uses, the disease or disorder is selected from the group consisting of systemic lupus erythematosus (SLE), lupus nephritis, cutaneous lupus erythematosus, Sjögren's syndrome, scleroderma (systemic sclerosis), multiple sclerosis, diabetes (e.g. Type I diabetes), polymyositis, primary biliary cirrhosis, IgG4-related disease, IgA nephropathy, IgA vasculitis, ANCA vasculitis (microscopic polyangiitis, granulomatosis with polyangiitis [Wegener's granulomatosis], eosinophilic granulomatosis with polyangiitis [Churg-Strauss]) cryoglobulinemia, cold agglutinin or warm agglutinin disease,

immune thrombocytopenic purpura, optic neuritis, amyloidosis, antiphospholipid antibody syndrome (APS), autoimmune polyglandular syndrome type II (APS II), autoimmune thyroid disease (AITD), Graves' disease, autoimmune adrenalitis, pemphigus vulgaris, bullous pemphigoid, myasthenia gravis, graft versus host disease (GVHD), transplantation, rheumatoid arthritis, acute lupus nephritis, amyotrophic lateral sclerosis, neuromyelitis optica, transverse myelitis, Rasmussen's encephalitis, CNS autoimmunity, Guillain-Barre syndrome, chronic inflammatory demyelinating polyneuropathy, neurocystercosis, sarcoidosis, antiphospholipid antibody syndrome, IgG4-related disease, Hashimoto's thyroiditis, immune thrombocytopenia, Addison's Disease, and dermatomyositis.

[0035] In embodiments of any of the provided methods or uses, the disease or disorder is an autoantibody-associated glomerular disease. In some embodiments, the autoantibody-associated glomerular disease is immunoglobulin (Ig) A nephropathy (IgAN), lupus nephritis (LN), primary membranous nephropathy (pMN), or renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV). In some embodiments, the disease or disorder is autoantibody-associated glomerular disease is immunoglobulin (Ig) A nephropathy (IgAN). In some embodiments, the disease or disorder is lupus nephritis (LN). In some embodiments, the disease or disorder is primary membranous nephropathy (pMN). In some embodiments, the disease or disorder is renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV).

[0036] In embodiments of any of the provided methods or uses, the disease or disorder is a B cell cancer. In some embodiments, the B cell cancer is myeloma, B cell chronic lymphocytic leukemia, Waldenstrom's macroglobulinemia or non-Hodgkin's lymphoma. In some of any embodiments, the type of myeloma includes multiple myeloma, plasmacytoma, multiple solitary plasmacytoma, and/or extramedullary myeloma. In some of any embodiments, the type of myeloma includes light chain myeloma, nonsecretory myeloma, and/or IgD or IgE myeloma.

[0037] In embodiments of any of the provided methods or uses, the subject is a human.

[0038] In embodiments of any of the provided methods or uses, the TACI-Fc fusion protein is provided in a formulation comprising an acetic acid buffer having a pH of from about 4.0 to about 6.0, proline at a concentration of from at or about 1% to about 10%, and a surfactant at a concentration of from about 0.005 to about 0.05% (w/v). In some of any embodiments, the formulation has a pH of about 5.2. In some of any embodiments, the acetic acid buffer comprises a concentration of acetate of from at or about 5 mM to at or about 15 mM. In some of any embodiments, the acetic acid buffer comprises a concentration of acetate of at or about 10

mM. In some of any embodiments, the proline is at a concentration of about 2% to about 5%. In some of any embodiments, the proline is at a concentration of at or about 3%. In some of any embodiments, the surfactant is at a concentration of at or about 0.015% (w/v). In some embodiments, the surfactant is polysorbate 80.

[0039] In some of any embodiments, the amount of TACI-Fc fusion protein in the formulation is from about 50 mg to about 100 mg. In some of any embodiments, the amount of TACI-Fc fusion protein in the formulation is at or about 80 mg. In some of any embodiments, the concentration of the TACI-Fc fusion protein is between about 50 mg/mL and about 200 mg/mL. In some of any embodiments, the concentration of the TACI-Fc fusion protein is at or about 100 mg/mL.

[0040] Disclosed herein is a formulation comprising a TACI-Fc fusion protein, an acetic acid buffer having a pH of from about 4.0 to about 6.0, proline at a concentration of from at or about 1% to about 10%, and a surfactant at a concentration of from about 0.005 to about 0.05% (w/v), wherein the TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D in the amino acid sequence set forth in SEQ ID NO:13.

[0040a] Disclosed herein is a formulation comprising a TACI-Fc fusion protein, an acetic acid buffer having a pH of 4.0 to 6.0, proline at a concentration of 1% to 10%, and a surfactant at a concentration of 0.005 to 0.05% (w/v), wherein the TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D with reference to the amino acid sequence set forth in SEQ ID NO:13, wherein the amino acid position numbering corresponds to that of SEQ ID NO: 122

[0041] In some of any embodiments, the variant TACI polypeptide of the TACI-Fc fusion protein in the formulation is set forth in SEQ ID NO:26. In some of any embodiments, the linker of the TACI-Fc fusion protein in the formulation is selected from GSGGS (SEQ ID NO: 76), GGGGS (G4S; SEQ ID NO: 77), GSGGGGS (SEQ ID NO: 74), GGGSGGGGS (2xGGGGS; SEQ ID NO: 78), GGGSGGGGS (3xGGGGS; SEQ ID NO: 79), GGGSGGGGS (4xGGGGS, SEQ ID NO:84), GGGSGGGGS (5xGGGGS, SEQ ID NO: 91), GGGGSSA (SEQ ID NO: 80), or GSGGGSGGGGS (SEQ ID NO:194) or combinations thereof. In some of any embodiments, the linker is set forth in SEQ ID NO: 74.

[0042] In some of any embodiments, the Fc of the TACI-Fc fusion protein in the formulation is an IgG1 Fc domain. In some of any embodiments, the Fc is a variant IgG1 Fc that exhibits reduced binding affinity to an Fc receptor and/or reduced effector function as compared to a wild-type IgG1 Fc domain. In some of any embodiments, the variant IgG1 Fc domain comprises one or more amino acid substitutions selected from L234A, L234V, L235A, L235E, G237A, S267K, R292C, N297G, and V302C, by EU numbering. In some of any embodiments, the variant IgG1 Fc comprises the amino acid substitutions L234A, L235E, and G237A by EU numbering.

[0043] In some of any embodiments, the Fc comprises the amino acid substitution C220S, wherein the residues are numbered according to the EU index of Kabat. In some of any embodiments, the Fc lacks the hinge sequence EPKSS or EPKSC. In some of any embodiments, the Fc region comprises K447del, wherein the residue is numbered according to the EU index of Kabat.

[0044] In some of any embodiments, the Fc of the TACI-Fc fusion protein in the formulation comprises the amino acid sequence set forth in SEQ ID NO:73. In some of any embodiments, the TACI-Fc fusion protein in the formulation has the sequence set forth in SEQ ID NO: 167. In some of any embodiments, the Fc of the TACI-Fc fusion protein in the formulation comprises the amino acid sequence set forth in SEQ ID NO:81. In some of any embodiments, the TACI-Fc fusion protein in the formulation has the sequence set forth in SEQ ID NO: 168.

[0045] In some of any embodiments, the formulation has a pH of about 5.2. In some of any embodiments, the acetic acid buffer comprises a concentration of acetate of from at or about 5 mM to at or about 15 mM. In some of any embodiments, the acetic acid buffer comprises a concentration of acetate of at or about 10 mM. In some of any embodiments, the proline is at a concentration of about 2% to about 5%. In some of any embodiments, proline is at a concentration of at or about 3%. In some of any embodiments, the surfactant is at a concentration of from about 0.01 to about 0.025% (w/v). In some of any embodiments, the surfactant is at a concentration of at or about 0.015% (w/v). In some embodiments, the surfactant is polysorbate 80.

[0046] In some of any embodiments, the amount of TACI-Fc fusion protein in the formulation is from about 50 mg to about 100 mg. In some of any embodiments, the amount of TACI-Fc fusion protein in the formulation is at or about 80 mg. In some of any embodiments, the concentration of the TACI-Fc fusion protein is between about 50 mg/mL and about 200

mg/mL. In some of any embodiments, the concentration of the TACI-Fc fusion protein is at or about 100 mg/mL.

[0047] In some of any embodiments, the formulation is a liquid. In some of any embodiments, the volume of the formulation is 0.5 mL to 2.0 mL. In some of any embodiments, the volume of the formulation is at or about 0.8 mL.

[0048] Also disclosed herein is a container comprising any of the provided formulations, such as a formulation of any of the above features. In some of any embodiments, the container is a vial or a pre-filled syringe. In some of any embodiments, the container is a vial that is glass. In some of any embodiments, the container holds a volume of up to at or about 5 mL. In some of any embodiments, the container holds a volume of up to at or about 2 mL. In some embodiments, the container is a 2 mL glass vial.

[0049] In some of any embodiments is provided, a method of reducing an immune response in a subject, comprising administering a therapeutically effective amount of the formulation to a subject in need thereof.

[0049a] Disclosed herein is a formulation as defined herein for use in reducing an immune response in a subject in need thereof.

[0049b] Disclosed herein is the use of a formulation as defined herein in the manufacture of a medicament for reducing an immune response in a subject.

[0049c] Disclosed herein is the use of a formulation as defined herein in the manufacture of a medicament for reducing an immune response in a subject, wherein reducing the immune response is for treating a disease, disorder or condition in the subject.

[0050] In some of any embodiments, a B cell immune response is reduced in the subject, whereby B cell maturation, differentiation and/or proliferation is reduced or inhibited. In some of any embodiments, circulating levels of APRIL, BAFF or an APRIL/BAFF heterotrimer are reduced in the subject. In some of any embodiments, reducing the immune response treats a disease, disorder or condition in the subject. In some of any embodiments is provided, a method of reducing circulating levels of APRIL, BAFF or an APRIL/BAFF heterotrimer in a subject comprising administering a therapeutically effective amount of the formulation.

[0050a] Disclosed herein is a formulation as defined herein for use in reducing circulating levels of APRIL, BAFF or an APRIL/BAFF heterotrimer in a subject.

[0051] Also provided is a method of treating a disease, disorder or condition in a subject, comprising administering a therapeutically effective amount of any of the provided formulations, including any with features as above, to a subject in need thereof. In some of any

embodiments, the disease, disorder or condition is an autoimmune disease, and inflammatory condition, a B cell cancer, an antibody- mediated pathology, a renal disease, a graft rejection, graft versus host disease, or a viral infection. In some of any embodiments, the disease, disorder or condition is selected from the group consisting of Systemic lupus erythematosus (SLE); Sjögren's syndrome, scleroderma, Multiple sclerosis, diabetes, polymyositis, primary biliary cirrhosis, IgA nephropathy, IgA vasculitis, optic neuritis, amyloidosis, antiphospholipid antibody syndrome (APS), autoimmune polyglandular syndrome type II (APS II), autoimmune thyroid disease (AITD), Graves' disease, autoimmune adrenalitis and pemphigus vulgaris.

[0051a] Disclosed herein is a formulation as defined herein for use in treating a disease, disorder, or condition in a subject in need thereof.

[0051b] Disclosed herein is the use of a formulation as defined herein in the manufacture of a medicament for treating a disease, disorder or condition in a subject.

[0052] In embodiments of any of the provided methods or uses, the disease or disorder is an autoantibody-associated glomerular disease. In some embodiments, the autoantibody-associated glomerular disease is immunoglobulin (Ig) A nephropathy (IgAN), lupus nephritis (LN), primary membranous nephropathy (pMN), or renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV). In some embodiments, the disease or disorder is autoantibody-associated glomerular disease is immunoglobulin (Ig) A nephropathy (IgAN). In some embodiments, the disease or disorder is lupus nephritis (LN). In some embodiments, the disease or disorder is primary membranous nephropathy (pMN). In some embodiments, the disease or disorder is renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV).

[0053] In some of any embodiments, the disease, disorder or condition is a B cell cancer and the cancer is myeloma.

Brief Description of the Drawings

[0054] **FIG. 1** shows a schematic representation of a functional inhibition assay involving recombinant APRIL and BAFF by TACI. In the assay, Jurkat cells transduced with a luciferase-based NF- κ B reporter and to stably express mouse or human TACI on the cell-surface expression. Following activation by recombinant APRIL or BAFF, endogenous NF- κ B transcription factors bind to the DNA response elements controlling transcription of a firefly

luciferase gene. Luciferase expression can be monitored, such as by detection with Bio-Glo™ reagent and measurement using a Cytation 3 reader.

[0055] **FIG. 2** shows exemplary human TACI TD Fc fusion molecules for blockade of human APRIL (top panel) and BAFF (bottom panel) mediated signaling. TACI TD Fc fusions were incubated with APRIL or BAFF for 20mins (room temperature with shaking) and then added to wells containing 150,000 Jurkat/TACI/NFκB-luciferase cells for 5 hours.

[0056] **FIG. 3A** shows function of exemplary TACI TD Fc fusion molecules for blockade of APRIL (top panel of the FIG) or BAFF (bottom panel of the FIG).

[0057] **FIG. 3B** shows human TACI TD Fc fusion molecules for blockade of mouse APRIL (left panel) and BAFF (right panel) mediated signaling.

[0058] **FIG. 4** shows human TACI TD Fc fusion molecules for blockade of human APRIL (top panel) and BAFF (bottom panel) mediated signaling relative to TACI 13-118-Fc, TACI 30-110-Fc, and belimumab.

[0059] **FIG. 5A-C** shows exemplary human TACI TD Fc fusion molecule 26 TACI CRD2-Fc for blockade of BAFF- (**FIG. 5A**), APRIL- (**FIG. 5B**), and a combination of BAFF+APRIL-mediated (**FIG. 5C**) signaling relative to belimumab, BION-1301, and WT TACI-Fc molecules including WT TACI 30-110 (atacept) and WT TACI 13-118-Fc (telitacept).

[0060] **FIGS. 6A-6J** show analysis of parameters assessed in an NZB/NZW murine model of human SLE. Proteinuria scores (**FIG. 6A**), mean percent change in body weight (**FIG. 6B**), and percent survival (**FIG. 6C**) were assessed starting at 20 weeks of age. Serum was analyzed for anti-double stranded DNA IgG titers (**FIG. 6D**) and blood urea nitrogen (BUN) (**FIG. 6E**) (**** vs Fc by Student's t-test, $p < 0.0001$ for anti-dsDNA IgG; *** vs Fc by Student's t-test, $p = 0.0008$ for BUN-4). Kidneys were processed and analyzed by histology in replicate Periodic acid-Schiff (PAS)-stained sections, with individual component and total histology scores depicted in **FIG. 6F**. Frozen kidneys were also sectioned and stained for immunohistochemical analysis of mouse IgG and complement C3 glomerular deposition, as shown in **FIG. 6G** and **FIG. 6H**, respectively. **FIG. 6I** shows the histological score $\pm$ SEM. Sialadenitis as measured by submandibular gland histology score is shown in **FIG. 6J**.

[0061] **FIG. 7** shows the ability of TACI mutations (K77E/F78Y/Y102D) to inhibit APRIL (left panel) and BAFF (right panel) mediated signaling, quantified by luciferase production in Jurkat/NF-κB/TACI cells.

[0062] **FIG. 8A and FIG. 8B** depict schematic representations of exemplary TACI-Fc fusion proteins. **FIG. 8A** depicts an exemplary TACI-Fc fusion protein containing two cysteine-

rich pseudo-repeats (CRD). **FIG. 8B** depicts an exemplary TACI-Fc fusion protein containing one cysteine-rich pseudo-repeat (CRD, e.g. CRD2).

[0063] **FIG. 9** depicts exemplary sequence alignments to identify corresponding residues in a sequence compared to a reference sequence. The symbol “*” between two aligned amino acid indicates that the aligned amino acids are identical. The symbol “-” indicates a gap in the alignment. Exemplary, non-limiting positions for amino acid substitution described herein are indicated with bold text. Based on the alignment of two similar sequences having identical residues in common, a skilled artisan can identify “corresponding” positions in a sequence by comparison to a reference sequence using conserved and identical amino acid residues as guides. **FIG. 9** provides an exemplary alignment of a reference TACI extracellular domain sequence set forth in SEQ ID NO:122 (containing the full extracellular domain with a CRD1 and CRD2 and an initiating methionine residue) with a TACI extracellular domain sequence set forth in SEQ ID NO:13 (containing only a single CRD, CRD2); aligning identical residues demonstrates, for example, that amino acid residue E7 in SEQ ID NO:13 corresponds to residue E74 in SEQ ID NO: 122, amino acid residue K10 in SEQ ID NO: 13 corresponds to residue K77 in SEQ ID NO:122, amino acid residue Y12 in SEQ ID NO: 13 corresponds to Y79 in SEQ ID NO:122, amino acid residue L15 in SEQ ID NO:13 corresponds to L82 in SEQ ID NO:122, amino acid residue R17 in SEQ ID NO: 13 corresponds to R84 in SEQ ID NO:122; and amino acid residue D16 in SEQ ID NO:13 correspond to D85 in SEQ ID NO:122. It is within the level of a skilled artisan to carry out similar alignments between two similar protein sequences to identify corresponding residues, including based on the exemplification and description herein.

[0064] **FIGS. 10A-10D** show analysis of parameters assessed murine keyhole limpet hemocyanin (KLH) model. Serum-KLH IgM OD levels were assessed as primary response (**FIG. 10A**) and secondary response (**FIG. 10B**). Similarly, serum anti-KLH IgG1 OD levels were assessed as both primary response (**FIG. 10C**) and secondary response (**FIG. 10D**).

[0065] **FIGS. 11A-11B** show analysis of harvested spleen assessed from the murine keyhole limpet hemocyanin (KLH) immunization model. Spleens were processed and analyzed by weight (**FIG. 11A**) as well as total cell number (**FIG. 11B**).

[0095] FIG. 42 levels of serum IgA, IgM, and IgG (IgG1, IgG2b, and IgG3) in animals receiving the exemplary TACI-Fc fusion in a mouse model of Autoantibody-Related Glomerulonephritis.

Detailed Description

[0096] Provided herein are immunomodulatory proteins that engage with one or more ligand, e.g. produced as soluble factors, to suppress or reduce B cell responses or activity. Among the provided immunomodulatory proteins are proteins that bind to BAFF or APRIL ligands to neutralize their activity and block or antagonize the activity of B cell stimulatory receptors, such as TACI or BCMA. The provided immunomodulatory proteins may be fusion proteins of a TACI extracellular domain or binding portion thereof (hereinafter TACI ECD) and a multimerization domain, such as an immunoglobulin Fc. For example, provided herein are TACI-Fc fusion proteins. In some embodiments, the immunomodulatory proteins provided herein can be used for the treatment of diseases, disorders or conditions that are associated with a dysregulated immune response, such as associated with inflammatory or autoimmune symptoms including an inflammatory disease or an autoimmune disease.

[0097] The immune system relies on immune checkpoints to prevent autoimmunity (i.e., self- tolerance) and to protect tissues from excessive damage during an immune response, for example during an attack against a pathogenic infection. In some cases, however, the immune system can become dysregulated and an abnormal immune response can be mounted against a normal body part or tissue, resulting in an autoimmune disease or condition or autoimmune symptoms. In other cases, an unwanted immune response can be mounted to a foreign tissue, such as a transplant, resulting in transplant rejection.

[0098] In some aspects immunotherapy that alters immune cell activity, such as B cell activity, can treat certain diseases, disorders and conditions in which the immune response is dysregulated. In particular, inhibition or attenuation of an immune response, such as a B cell response, could be desirable to reduce or prevent unwanted inflammation, autoimmune symptoms and/or transplant rejection. Therapeutic approaches that seek to modulate interactions between ligands and their receptors that mediate an immune response, however, are not entirely satisfactory. In some cases, therapies to intervene and alter the immunomodulatory effects of immune cell, e.g. B cell, activation are constrained by the spatial orientation requirements as well as size limitations imposed by the confines of the immunological synapse. In some aspects existing therapeutic drugs, including antibody drugs, may not be able to interact simultaneously

with the multiple target proteins involved in modulating these interactions. For example, soluble receptors and antibodies generally bind competitively (e.g., to no more than one target species at a time) and therefore lack the ability to simultaneously bind multiple targets. Additionally, pharmacokinetic differences between drugs that independently target one of these receptors can create difficulties in properly maintaining a desired blood concentration of a drug combination targeting two different targets throughout the course of treatment.

[0099] BAFF and APRIL are TNF superfamily members that bind both TACI and BCMA receptors on B cells; BAFF also binds a 3rd receptor, BAFF receptor (BAFF-R). Both BAFF and APRIL can bind and activate BCMA and TACI; BAFF also binds and activates the BAFF-R (Xu et al. 2020 *Cancers (Basel)* 12(4):1045). Together, BAFF and APRIL support B cell development, differentiation, and survival, particularly for plasmablasts and plasma cells, and play a role in the pathogenesis of B cell-related autoimmune diseases. BAFF and APRIL are initially expressed as transmembrane proteins, primarily on stromal cells and cells of myeloid origin (Smulski et al. *Front. Immunol.* 2018 9:2285) and can be cleaved to release soluble cytokines. BAFF circulates as homotrimers, as 60-mers, or as a heterotrimers containing 2 APRIL and 1 BAFF, or 2 BAFF and 1 APRIL protomers. APRIL circulates as homo- or heterotrimers and can be localized to the intracellular matrix or cell surfaces through interaction with heparin sulphate proteoglycans.

[0100] The expression of BAFF and APRIL increases under proinflammatory conditions (Smulski et al. 2018), and elevated serum levels of these cytokines have been correlated with disease severity in patients with B cell-related autoimmune disease, including systemic lupus erythematosus (SLE) (Samy et al. *Int. Rev. Immunol.* 2017 36:3-19). Binding of BAFF/APRIL to their receptors triggers events in B cell and plasma cell development, differentiation, and activation. For instance, activation of the BAFF-R contributes to survival and maturation of transitional and naïve B cells whereas TACI is involved in T cell-independent B cell responses to certain antigens, B cell regulation, and immunoglobulin (Ig) class-switch recombination. BCMA, which is upregulated in activated B cells, is important for the long-term survival of plasma cells.

[0101] Inhibitors of BAFF and/or APRIL have been investigated in clinical trials for the treatment of a variety of autoimmune or other B-cell related diseases. An inhibitor of BAFF, belimumab (Benlysta®) has been approved for treatment of SLE (Benlysta Product Information, 2020), and single-pathway inhibitors of APRIL (e.g., BION1301 and VIS649) are currently being evaluated in Phase 2 studies [NCT04684745; NCT04287985].

[0102] The co-neutralization of BAFF and APRIL dramatically reduces B cell function, including antibody production, whereas inhibition of either BAFF or APRIL alone mediates relatively modest effects. Fc fusions of wild-type (WT) extracellular domain of TACI and the Fc

domain of IgG1 (e.g. atacicept and telitacept) are in clinical development and target both BAFF and APRIL. These dual BAFF/APRIL antagonists have been shown to inhibit the survival of immature and mature B cells and plasma cells, while sparing B cell progenitors and memory B cells (Cogollo et al. 2015 *Drug Des Devel Ther.* 9:1331-9; Samy et al. 2017; Zhao et al. 2016 *J Clin Pharmacol.* 56:948-959). Levels of serum IgG, IgM, and IgA and numbers of mature and total circulating B cells are reduced by both (Cogollo et al. 2015; Chen et al. 2014 *Clin Pharmacokinet.* 53:1033-44; Chen et al. 2016 *Br J Clin Pharmacol.* 82:41-52; Zhao et al. 2016). When compared directly to inhibition of either BAFF or APRIL alone in nonclinical studies, dual inhibitors have shown more pronounced pharmacodynamic (PD) effects and greater modification of disease models (Ramanujam et al. 2006 *J Clin Invest.* 116:724-34; Benson et al. 2008 *J Immunol.* 180:3655-3659; Haselmeyer et al. 2017 *J. Immunol.* 47:1075-1085; Samy et al. 2017). Atacicept and telitacept have demonstrated promising clinical potential in certain autoimmune diseases e.g. systemic lupus erythematosus (SLE) and IgA nephropathy, but have not yet clearly exhibited long-term and/or complete disease remissions. While B cell targeting therapies have demonstrated promising therapeutic potential, they are not entirely satisfactory. For instance, soluble recombinant TACI (e.g. atacicept or telitacept) demonstrates considerable promise as a therapeutic, but its usefulness appears hindered by low to moderate affinity to APRIL.

[0103] Among provided embodiments are those that provide for improved neutralizing activity and suppression or reduction of B cell responses. In some embodiments, the improved activity is mediated by increased or improved binding or interaction of the provided immunomodulatory proteins (e.g. TACI-Fc fusion protein) with BAFF and/or APRIL. The provided immunomodulatory proteins block or antagonize interactions of BAFF or APRIL, such as homotrimers of BAFF or APRIL, heterotrimers of BAFF/APRIL or BAFF 60mers, with a cognate B cell stimulatory receptor, and thereby neutralize activity of BAFF and/or APRIL ligands. In some embodiments, the provided immunomodulatory proteins reduce one or more B cell response or activity, including the ability of B cells to produce immunoglobulins. In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc fusion protein), when administered to a subject, reduce circulating serum immunoglobulins. In some embodiments, the provided immunomodulatory proteins reduce one or more of B cell maturation, differentiation and proliferation. In provided aspects, such activity is improved or superior to that achieved by a WT TACI-Fc fusion protein (e.g. telitacept or atacicept). In some embodiments, the provided immunomodulatory proteins (TACI-Fc fusion protein) are

candidate therapeutics for the treatment of multiple autoimmune and inflammatory diseases, particularly B cell-related diseases, such as SLE, SjS, and other connective tissue diseases.

[0104] Provided embodiments include methods and uses of a particular Fc fusion protein of a TACI variant TNF receptor domain (TD, i.e. CRD2) that simultaneously inhibits the BAFF and APRIL cytokines. Provided embodiments relate to identification of variant TACI polypeptides engineered to have improved affinity towards APRIL and/or BAFF following random mutagenesis and directed evolution of the second cysteine rich domain (CRD2) of TACI, spanning residues 68-110. As shown herein, the affinity maturation included five selections alternating between APRIL and BAFF, with concurrent decreases in selection reagent concentration to maintain selection pressure. Results demonstrated variant TACI polypeptides that exhibit substantially enhanced affinity for BAFF and APRIL as compared to wild-type TACI. For example, provided herein are variant TACI polypeptides that contain one or more amino acid substitutions (replacement or mutations) that confer improved binding affinity of the protein for BAFF and/or APRIL. In particular, among provided embodiments are those that provide for improved, combined BAFF and APRIL inhibition. Thus, the provided immunomodulatory proteins provide effective and durable disease suppression in the treatment of autoimmune or inflammatory diseases, including in severe B cell-related autoimmune diseases like SLE.

[0105] For example, the provided embodiments are based on findings that directed evolution by affinity modification of TNFR domain (TD) of the ectodomain of TACI facilitated the development of molecules with improved affinity for APRIL and/or BAFF. Thus, the affinity modification produces a variant TACI that contains a variant TNFR domain (vTD). Fusion of such molecules with an immunoglobulin Fc results in immunomodulatory proteins that suppress B cell activity and response. For instance, reformatted as a soluble Fc fusion protein, the affinity-matured TACI variant outputs exhibited inhibition of APRIL and BAFF, as shown herein in a TACI-dependent reporter assay, and with lower IC₅₀ values than wild-type TACI-Fc and belimumab comparators. Further, results in evaluated animal models demonstrate rapid and significantly reduced key lymphocyte subsets including plasma cells, germinal center B cells, and follicular T helper cells. Further, tested variant molecules exhibited improved activities in mouse models, including significantly reduced autoantibodies and sialadenitis in the spontaneous SjS model, inhibited glomerular IgG deposition in the bm12-induced model of lupus, and potently suppressed anti-dsDNA autoAbs, blood urea nitrogen levels, proteinuria, sialadenitis, kidney lesions and renal immune complex deposition in the NZB/W lupus model.

Further, as compared to wild-type TACI-Fc, tested TACI-Fc fusions exhibited significantly and persistently decreased titers of serum IgM, IgG, and IgA antibodies in mice. The findings herein demonstrate these immunomodulatory proteins consistently exhibit potent immunosuppressive activity and efficacy *in vitro* and *in vivo*, appearing superior to existing and/or approved immunomodulators like belimumab, abatacept, atacicept, or telitacicept. Such biologics may therefore be attractive development candidates for the treatment of serious autoimmune and/or inflammatory diseases, including B cell-related diseases such as SLE, Sjögren's syndrome, and other connective tissue diseases.

[0106] Moreover, observations herein demonstrate that the TACI-Fc fusion proteins exhibit high serum exposure when administered to mice and cynomolgus monkeys. The favorable and higher serum exposure, as well as the more potent immunosuppressive activities, achieved by the provided TACI-Fc fusion proteins supports their use at a lower clinical dose and/or at a reduced dosing frequency (or longer dosing interval) than existing WT TACI-Fc therapeutics. For instance, existing WT TACI-Fc therapeutics, such as telitacicept and atacicept, must be administered at least once weekly. Reducing the dose frequency may provide a treated subject with better symptom control, improve adherence to the dosing regimen, increase patient quality of life or patient satisfaction and/or overall reduce the costs of receiving the treatment. Moreover, reducing the dose, even at a more regular frequency such as once weekly, may also mitigate against certain adverse effects.

[0107] All publications, including patent documents, scientific articles and databases, referred to in this application are incorporated by reference in their entirety for all purposes to the same extent as if each individual publication were individually incorporated by reference. If a definition set forth herein is contrary to or otherwise inconsistent with a definition set forth in the patents, applications, published applications and other publications that are herein incorporated by reference, the definition set forth herein prevails over the definition that is incorporated herein by reference.

[0108] The section headings used herein are for organizational purposes only and are not to be construed as limiting the subject matter described.

I. DEFINITIONS

[0109] Unless defined otherwise, all terms of art, notations and other technical and scientific terms or terminology used herein are intended to have the same meaning as is commonly understood by one of ordinary skill in the art to which the claimed subject matter

pertains. In some cases, terms with commonly understood meanings are defined herein for clarity and/or for ready reference, and the inclusion of such definitions herein should not necessarily be construed to represent a substantial difference over what is generally understood in the art.

[0110] As used in the specification and the appended claims, the singular forms “a,” “an,” and “the” include plural referents unless the context clearly indicates otherwise.

[0111] The term “about” as used herein refers to the usual error range for the respective value readily known to the skilled person in this technical field. Reference to “about” a value or parameter herein includes (and describes) embodiments that are directed to that value or parameter *per se*. For example, description referring to “about X” includes description of “X”.

[0112] The term “affinity-modified” as used in the context of a domain of a protein means a mammalian protein having an altered amino acid sequence in an extracellular domain or a specific binding portion thereof (relative to the corresponding wild-type parental or unmodified domain) such that it has an increased or decreased binding activity, such as binding affinity, to at least one of its binding partners (alternatively “counter-structures”) compared to the parental wild-type or unmodified (i.e., non-affinity modified domain) protein. In some embodiments, the affinity-modified domain can contain 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 or more amino acid differences, such as amino acid substitutions, in a wild-type or unmodified domain. An increase or decrease in binding activity, e.g. binding affinity, can be determined using well known binding assays, including flow cytometry. Larsen et al., American Journal of Transplantation, Vol 5: 443-453 (2005). See also, Linsley et al., Immunity, 1: 7930801 (1994). An increase in a protein’s binding activity, e.g. affinity, to its binding partner(s) is to a value at least 10% greater than that of the wild-type control and in some embodiments, at least 20%, 30%, 40%, 50%, 100%, 200%, 300%, 500%, 1000%, 5000%, or 10000% greater than that of the wild-type control value. A decrease in a protein’s binding activity, e.g. affinity, to at least one of its binding partner is to a value no greater than 90% of the control but no less than 10% of the wild-type control value, and in some embodiments no greater than 80%, 70% 60%, 50%, 40%, 30%, or 20% but no less than 10% of the wild-type control value. An affinity-modified protein is altered in primary amino acid sequence of the extracellular domain or a specific binding portion thereof by substitution, addition, or deletion of amino acid residues. The term “affinity-modified” is not be construed as imposing any condition for any particular starting composition or method by which the affinity-modified protein was created. Thus, an affinity-modified protein is not limited to wild-type

protein domains that are then transformed to an affinity-modified domain by any particular process of affinity modification. An affinity-modified domain polypeptide can, for example, be generated starting from wild-type mammalian domain sequence information, then modeled in silico for binding to its binding partner, and finally recombinantly or chemically synthesized to yield the affinity-modified domain composition of matter. In but one alternative example, an affinity-modified domain can be created by site-directed mutagenesis of a wild-type domain. Thus, affinity modified TD domain denotes a product and not necessarily a product produced by any given process. A variety of techniques including recombinant methods, chemical synthesis, or combinations thereof, may be employed.

[0113] The term “affinity-modified TD domain” refers to an affinity-modified domain of a member of the tumor necrosis receptor superfamily (TNFRSF) protein or a TNF ligand thereof having an altered amino acid sequence of a TNFR domain or of a TNF domain therein, respectively. For example, an affinity-modified TD domain of a TNFRSF protein has an altered amino acid sequence of a TNFR domain composed of at least one cysteine rich domain (CRD) within the extracellular domain of the TNFRSF protein or a specific binding portion thereof (relative to the corresponding wild-type parental or unmodified domain) such that it has an increased or decreased binding activity, such as binding affinity, to at least one of its binding partners (alternatively “counter-structures”) compared to the parental wild-type or unmodified protein containing the non-affinity modified or unmodified TD domain.

[0114] An “affinity-modified TACI (also referred to as a variant TACI) refers to a TACI protein molecule that antagonizes or blocks the activity of a B cell stimulatory receptor. For example, TACI binds to APRIL and/or BAFF, which are ligands of the B cell stimulatory receptors B cell maturation antigen (BCMA), B cell activation factor receptor (BAFF-R), and transmembrane activator and calcium modulator and cyclophilin ligand interactor (TACI). In particular embodiments, a BIM includes the extracellular domain of TACI, or a portion of the extracellular domain of TACI containing a TNF receptor family domain (e.g. TD, e.g. CRD) that binds to cognate ligands APRIL and/or BAFF, and heterotrimers of APRIL and BAFF. An affinity-modified variant of the extracellular domain or portion thereof of TACI can include one more amino acid modifications (e.g. amino acid substitutions) in the TD that increase binding affinity for the cognate ligand (e.g. APRIL and/or BAFF, and heterotrimers of APRIL and BAFF).

[0115] As used herein, a “B cell stimulatory receptor” refers to one or more of B cell maturation antigen (BCMA), B cell activation factor receptor (BAFF-R), and transmembrane

activator and calcium modulatory and cyclophilin ligand interactor (TACI), which are related tumor necrosis factor (TNFR) superfamily receptors expressed on B cells. Engagement or ligation of these related receptors by their cognate ligands, BAFF and/or APRIL, or heterotrimers of APRIL and BAFF, regulate B cell homeostasis, including B cell survival, B cell maturation and differentiation and immunoglobulin class switching. A B cell stimulatory receptor generally contains an extracellular portion, a transmembrane domain and cytoplasmic region, in which the cytoplasmic region contains one or more TNF receptor associated factor (TRAF) binding sites. Recruitment of various TRAF molecules to the cytoplasmic domain can activate various transcription factors, such as NF- κ B (e.g. NF- κ B1 or NF- κ B2), to mediate B cell signaling pathways regulating B cell homeostasis.

[0116] As used herein, "bind," "bound" or grammatical variations thereof refers to the participation of a molecule in any attractive interaction with another molecule, resulting in a stable association in which the two molecules are in close proximity to one another. Binding includes, but is not limited to, non-covalent bonds, covalent bonds (such as reversible and irreversible covalent bonds), and includes interactions between molecules such as, but not limited to, proteins, nucleic acids, carbohydrates, lipids, and small molecules, such as chemical compounds including drugs.

[0117] As used herein, binding activity refer to characteristics of a molecule, e.g. a polypeptide, relating to whether or not, and how, it binds one or more binding partners. A binding activity can include any measure of binding of one molecule for a binding partner. Binding activities include the ability to bind the binding partner(s), the affinity with which it binds to the binding partner (e.g. high affinity), the avidity with which it binds to the binding partner, the strength of the bond with the binding partner and/or specificity or selectivity for binding with the binding partner.

[0118] The term "binding affinity" as used herein means the specific binding affinity of a protein for its binding partner (i.e., its counter-structure) under specific binding conditions. The binding affinity refers to the strength of the interaction between two or more molecules, such as binding partners, typically the strength of the noncovalent interactions between two binding partners. An increase or attenuation in binding affinity of an affinity-modified domain, or an immunomodulatory protein containing an affinity-modified domain, to a binding partner is determined relative to the binding affinity of the unmodified domain (e.g., the native or wild-type TD domain). Methods for determining binding affinity, or relative binding affinity, are known in art, solid-phase ELISA immunoassays, ForteBio Octet, Biacore measurements or flow

cytometry. See, for example, Larsen et al., *American Journal of Transplantation*, vol. 5: 443-453 (2005); Linsley et al., *Immunity*, Vol 1 (9): 793-801 (1994). In some embodiments, binding affinity can be measured by flow cytometry, such as based on a Mean Fluorescence Intensity (MFI) in a flow binding assay.

[0119] The term “binding avidity” as used herein means the specific binding avidity, of a protein for its binding partner (i.e., its counter-structure) under specific binding conditions. In biochemical kinetics avidity refers to the accumulated strength of multiple affinities of individual non-covalent binding interactions, such as between a protein for its binding partner (i.e., its counter-structure). As such, avidity is distinct from affinity, which describes the strength of a single interaction.

[0120] The term “biological half-life” refers to the amount of time it takes for a substance, such as an immunomodulatory protein, to lose half of its pharmacologic or physiologic activity or concentration. Biological half-life can be affected by elimination, excretion, degradation (e.g., enzymatic degradation/digestion) of the substance, or absorption and concentration in certain organs or tissues of the body. In some embodiments, biological half-life can be assessed by determining the time it takes for the blood plasma concentration of the substance to reach half its steady state level (“plasma half-life”). Conjugates that can be used to derivatize and increase the biological half-life of a protein are known in the art and include, but are not limited to, multimerization domains (e.g. Fc immunoglobulin domain), polyethylene glycol (PEG), hydroxyethyl starch (HES), XTEN (extended recombinant peptides; see, WO2013130683), human serum albumin (HSA), bovine serum albumin (BSA), lipids (acylation), and poly-Pro-Ala-Ser (PAS), polyglutamic acid (glutamylation).

[0121] The term “cell surface counter-structure” (alternatively “cell surface binding partner”) as used herein is a counter-structure (alternatively is a binding partner) expressed on a mammalian cell. Typically, the cell surface binding partner is a transmembrane protein. In some embodiments, the cell surface binding partner is a receptor.

[0122] The terms “binding partner” or “counter-structure” in reference to a protein, such as a receptor, soluble ligand, or to an extracellular domain or portion thereof or affinity-modified variant thereof, refers to at least one molecule (typically a native mammalian protein) to which the referenced protein specifically binds under specific binding conditions. In some aspects an affinity-modified domain, or an immunomodulatory protein containing an affinity-modified domain, specifically binds to the binding partner of the corresponding domain of the native or wild-type protein but with increased or attenuated affinity. A “cell surface binding partner” is a

binding partner expressed on a mammalian cell. Typically, the cell surface binding partner is a transmembrane protein. In some embodiments, the cell surface binding partner is a receptor, or a ligand of a receptor expressed on and by cells, such as mammalian cells, forming the immunological synapse, for example immune cells.

[0123] The term “cis” with reference to binding to cell surface molecules refers to binding to two or more different cell surface molecules, each of which is present on the surface of the same cell. In some embodiments, cis means that the two or more cell surface molecules are exclusively on one or exclusively the other (but not both) of the two mammalian cells forming the IS.

[0124] The term “conservative amino acid substitution” as used herein means an amino acid substitution in which an amino acid residue is substituted by another amino acid residue having a side chain R group with similar chemical properties (e.g., charge or hydrophobicity). Examples of groups of amino acids that have side chains with similar chemical properties include 1) aliphatic side chains: glycine, alanine, valine, leucine, and isoleucine; 2) aliphatic-hydroxyl side chains: serine and threonine; 3) amide-containing side chains: asparagine and glutamine; 4) aromatic side chains: phenylalanine, tyrosine, and tryptophan; 5) basic side chains: lysine, arginine, and histidine; 6) acidic side chains: aspartic acid and glutamic acid; and 7) sulfur-containing side chains: cysteine and methionine. Conservative amino acids substitution groups are: valine-leucine-isoleucine, phenylalanine-tyrosine, lysine-arginine, alanine-valine, glutamate-aspartate, and asparagine-glutamine.

[0125] The term, “corresponding to” with reference to positions of a protein, such as recitation that nucleotides or amino acid positions “correspond to” nucleotides or amino acid positions in a disclosed sequence, such as set forth in the Sequence Listing, refers to nucleotides or amino acid positions identified upon alignment with the disclosed sequence based on structural sequence alignment or using a standard alignment algorithm, such as the GAP algorithm. By aligning the sequences, one skilled in the art can identify corresponding residues, for example, using conserved and identical amino acid residues as guides. FIG. 9 exemplifies identification of corresponding residues by aligning two sequences.

[0126] As used herein, “domain” (typically a sequence of three or more, generally 5 or 7 or more amino acids, such as 10 to 200 amino acid residues) refers to a portion of a molecule, such as a protein or encoding nucleic acid, that is structurally and/or functionally distinct from other portions of the molecule and is identifiable. For example, domains include those portions of a polypeptide chain that can form an independently folded structure within a protein made up of

one or more structural motifs and/or that is recognized by virtue of a functional activity, such as binding activity. A protein can have one, or more than one, distinct domains. For example, a domain can be identified, defined or distinguished by homology of the primary sequence or structure to related family members, such as homology to motifs. In another example, a domain can be distinguished by its function, such as an ability to interact with a biomolecule, such as a cognate binding partner. A domain independently can exhibit a biological function or activity such that the domain independently or fused to another molecule can perform an activity, such as, for example binding. A domain can be a linear sequence of amino acids or a non-linear sequence of amino acids. Many polypeptides contain a plurality of domains. Such domains are known, and can be identified by those of skill in the art. For exemplification herein, definitions are provided, but it is understood that it is well within the skill in the art to recognize particular domains by name. If needed appropriate software can be employed to identify domains. It is understood that reference to amino acids, including to a specific sequence set forth as a SEQ ID NO used to describe domain organization (e.g. of a TD domain) are for illustrative purposes and are not meant to limit the scope of the embodiments provided. It is understood that polypeptides and the description of domains thereof are theoretically derived based on homology analysis and alignments with similar molecules. Also, in some cases, adjacent N- and/or C-terminal amino acids of a given domain (e.g. TD) also can be included in a sequence, such as to ensure proper folding of the domain when expressed. Thus, the exact locus can vary, and is not necessarily the same for each protein. For example, a specific TD domain, such as specific CRD domain, can be several amino acids (1-10, such as 1, 2, 3, 4, 5, 6, 7, 8, 9 or 10 amino acids) longer or shorter.

[0127] The term “ectodomain,” “extracellular domain,” or “ECD,” which are used interchangeably herein, refers to a region of a membrane protein, such as a transmembrane protein, that lies outside the vesicular membrane (e.g., the space outside of a cell), when a full-length form of the membrane protein is expressed from a cell. For purposes herein, it is understood that reference to the ECD refers to sequences and domains that make up this region and do not require that a protein that contains an ECD is a membrane protein or that the domain is present outside a cell. For example, a soluble immunomodulatory protein can contain ECD sequences of a membrane protein fused to another moiety, such as a multimerization domain, for example an Fc region. Ectodomains often interact with specific ligands or specific cell surface receptors, such as via a binding domain that specifically binds to the ligand or cell surface receptor. Examples of binding domains include cysteine rich domains (CRDs). Ectodomains of members of the TNFR superfamily contain a TD domain (e.g. a CRD domain). Thus,

reference to an ECD herein includes a full-length sequence of an ECD of a membrane protein as well as specific-binding fragments thereof containing a CRD that bind to a ligand or cognate binding partner.

[0128] The terms “effective amount” or “therapeutically effective amount” refer to a quantity and/or concentration of a therapeutic composition, such as containing an immunomodulatory protein or Fc fusion protein, that when administered ex vivo (by contact with a cell from a patient) or in vivo (by administration into a patient) either alone (i.e., as a monotherapy) or in combination with additional therapeutic agents, yields a statistically significant inhibition of disease progression as, for example, by ameliorating or eliminating symptoms and/or the cause of the disease. An effective amount for treating a disease, condition or disorder, such as an immune system disease, condition or disorder, may be an amount that relieves, lessens, or alleviates at least one symptom or biological response or effect associated with the disease, condition or disorder, prevents progression of the disease, condition or disorder, or improves physical functioning of the patient. In the case of cell therapy, the effective amount is an effective dose or number of cells administered to a patient. In some embodiments the patient is a human patient.

[0129] As used herein, a fusion protein refers to a polypeptide encoded by a nucleic acid sequence containing a coding sequence for two or more proteins, in some cases 2, 3, 4, 5 or more protein, in which the coding sequences are in the same reading frame such that when the fusion construct is transcribed and translated in a host cell, the protein is produced containing the two or more proteins. Each of the two or more proteins can be adjacent to another protein in the construct or separated by a linker polypeptide that contains, 1, 2, 3, or more, but typically fewer than 20, 15, 10, 9, 8, 7, or 6 amino acids. The protein product encoded by a fusion construct is referred to as a fusion polypeptide. An example of a fusion protein in accord with the provided embodiments is an Fc fusion protein containing an affinity-modified domain (e.g. a variant of a TACI extracellular domain or portion thereof containing a CRD) that is linked to an immunoglobulin Fc domain.

[0130] The term “half-life extending moiety” refers to a moiety of a polypeptide fusion or chemical conjugate that extends the half-life of a protein circulating in mammalian blood serum compared to the half-life of the protein that is not so conjugated to the moiety. In some embodiments, half-life is extended by greater than or about 1.2-fold, about 1.5-fold, about 2.0-fold, about 3.0-fold, about 4.0-fold, about 5.0-fold, or about 6.0-fold. In some embodiments, half-life is extended by more than 6 hours, more than 12 hours, more than 24 hours, more than

48 hours, more than 72 hours, more than 96 hours or more than 1 week after *in vivo* administration compared to the protein without the half-life extending moiety. The half-life refers to the amount of time it takes for the protein to lose half of its concentration, amount, or activity. Half-life can be determined for example, by using an ELISA assay or an activity assay. Exemplary half-life extending moieties include an Fc domain, a multimerization domain, polyethylene glycol (PEG), hydroxyethyl starch (HES), XTEN (extended recombinant peptides; see, WO2013130683), human serum albumin (HSA), bovine serum albumin (BSA), lipids (acylation), and poly-Pro-Ala-Ser (PAS), and polyglutamic acid (glutamylation).

[0131] An Fc (fragment crystallizable) region or domain of an immunoglobulin molecule (also termed an Fc polypeptide) corresponds largely to the constant region of the immunoglobulin heavy chain, and which, in some cases, is responsible for various functions, including the antibody's effector function(s). The Fc domain contains part or all of a hinge domain of an immunoglobulin molecule plus a CH2 and a CH3 domain. In some cases for inclusion in a provided fusion protein, all or a portion of the Fc hinge sequence may be deleted. The Fc domain can form a dimer of two polypeptide chains joined by one or more disulfide bonds. In some embodiments, the Fc is a variant Fc that exhibits reduced (e.g. reduced greater than about 30%, 40%, 50%, 60%, 70%, 80%, 90% or more) activity to facilitate an effector function. In some embodiments, reference to amino acid substitutions in an Fc region is by EU numbering system unless described with reference to a specific SEQ ID NO. EU numbering is known and is according to the most recently updated IMGT Scientific Chart (IMGT®, the international ImMunoGeneTics information system®, http://www.imgt.org/IMGTScientificChart/Numbering/Hu_IGHGnber.html (created: 17 May 2001, last updated: 10 Jan 2013) and the EU index as reported in Kabat, E.A. et al. Sequences of Proteins of Immunological interest. 5th ed. US Department of Health and Human Services, NIH publication No. 91-3242 (1991).

[0132] An immunoglobulin Fc fusion ("Fc-fusion"), such as an immunomodulatory Fc fusion protein, is a molecule comprising one or more polypeptides operably linked to an Fc region of an immunoglobulin. An Fc-fusion may comprise, for example, an Fc region operably linked to a TACI extracellular domain or portion thereof containing a CRD, including any of the provided affinity-modified variants thereof. An immunoglobulin Fc region may be linked indirectly or directly to the one or more polypeptides. Various linkers are known in the art and can optionally be used to link an Fc to a fusion partner to generate an Fc-fusion. Fc-fusions of identical species can be dimerized to form Fc-fusion homodimers. Fc fusion of non-identical

species (e.g. knob into hole engineering) may be used to form Fc-fusion heterodimers. In some embodiments, the Fc is a mammalian Fc such as a murine or human Fc.

[0133] The term “host cell” refers to any cell that can be used to express a protein encoded by a recombinant expression vector. A host cell can be a prokaryote, for example, *E. coli*, or it can be a eukaryote, for example, a single-celled eukaryote (e.g., a yeast or other fungus), a plant cell (e.g., a tobacco or tomato plant cell), an animal cell (e.g., a human cell, a monkey cell, a hamster cell, a rat cell, a mouse cell, or an insect cell) or a hybridoma. Examples of host cells include Chinese hamster ovary (CHO) cells or their derivatives such as Veggie CHO and related cell lines which grow in serum-free media or CHO strain DX-B11, which is deficient in DHFR.

[0134] The term “immunological synapse” or “immune synapse” (abbreviated “IS”) as used herein means the interface between a mammalian cell that expresses MHC I (major histocompatibility complex) or MHC II, such as an antigen-presenting cell or tumor cell, and a mammalian lymphocyte such as an effector T cell or Natural Killer (NK) cell.

[0135] The term “immunoglobulin” (abbreviated “Ig”) as used herein is synonymous with the term “antibody” (abbreviated “Ab”) and refers to a mammalian immunoglobulin protein including any of the five human classes: IgA (which includes subclasses IgA1 and IgA2), IgD, IgE, IgG (which includes subclasses IgG1, IgG2, IgG3, and IgG4), and IgM. The term is also inclusive of immunoglobulins that are less than full-length, whether wholly or partially synthetic (e.g., recombinant or chemical synthesis) or naturally produced, including any fragment thereof containing at least a portion of the variable heavy (VH) chain and/or variable light (VL) chain region of the immunoglobulin molecule that is sufficient to form an antigen binding site and, when assembled, to specifically bind antigen. The antibody also can include all or a portion of the constant region. Such fragments include antigen binding fragment (Fab), variable fragment (Fv) containing VH and VL, the single chain variable fragment (scFv) containing VH and VL linked together in one chain, as well as other antibody V region fragments, such as Fab', F(ab)2, F(ab')2, dsFv diabody, Fc, and Fd polypeptide fragments. Hence, it is understood that reference to an antibody herein includes full-length antibody and antigen-binding fragments. The term antibody also includes antibody compositions with polyepitopic specificity, multispecific antibodies (e.g., bispecific antibodies), diabodies, and single-chain molecules. Bispecific antibodies, homobispecific and heterobispecific, are included within the meaning of the term. Antibodies include polyclonal antibodies or monoclonal antibodies. Antibody also includes synthetic antibodies or recombinantly produced antibodies. For the structure and properties of the different classes of antibodies, see e.g., *Basic and Clinical Immunology*, 8th Edition, Daniel

P. Sties, Abba I. Terr and Tristram G. Parslow (eds), Appleton & Lange, Norwalk, CT, 1994, page 71 and Chapter 6.

[0136] The terms “full-length antibody,” “intact antibody” or “whole antibody” are used interchangeably to refer to an antibody in its substantially intact form, as opposed to an antibody fragment. A full-length antibody is an antibody typically having two full-length heavy chains (*e.g.*, VH-CH1-CH2-CH3 or VH-CH1-CH2-CH3-CH4) and two full-length light chains (VL-CL) and hinge regions, such as antibodies produced from mammalian species (*e.g.* human, mouse, rat, rabbit, non-human primate, etc.) by antibody secreting B cells and antibodies with the same domains that are produced synthetically. Specifically, whole antibodies include those with heavy and light chains including an Fc region. The constant domains may be native sequence constant domains (*e.g.*, human native sequence constant domains) or amino acid sequence variants thereof. In some cases, the intact antibody may have one or more effector functions.

[0137] An “antibody fragment” comprises a portion of an intact antibody, the antigen binding and/or the variable region of the intact antibody. Antibody fragments, include, but are not limited to, Fab fragments, Fab' fragments, F(ab')₂ fragments, Fv fragments, disulfide-linked Fvs (dsFv), Fd fragments, Fd' fragments; diabodies; linear antibodies (see U.S. Pat. No. 5,641,870, Example 2; Zapata *et al.*, *Protein Eng.* 8(10): 1057-1062 [1995]); single-chain antibody molecules, including single-chain Fvs (scFv) or single-chain Fabs (scFab); antigen-binding fragments of any of the above and multispecific antibodies from antibody fragments.

[0138] “Fv” is composed of one heavy- and one light-chain variable region domain linked by non-covalent association. From the folding of these two domains emanate six complementarity determining regions (CDR) (3 in each from the heavy and light chain) that contribute the amino acid residues for antigen binding and confer antigen binding specificity to the antibody. However, even a single variable domain (or half of an Fv comprising only three CDRs specific for an antigen) has the ability to recognize and bind antigen, although, in some cases, at a lower affinity than the entire binding site.

[0139] “dsFv” refers to an Fv with an engineered intermolecular disulfide bond, which stabilizes the V_H-V_L pair.

[0140] An “Fd fragment” is a fragment of an antibody containing a variable domain (V_H) and one constant region domain (C_{H1}) of an antibody heavy chain.

[0141] A “Fab fragment” is an antibody fragment that results from digestion of a full-length immunoglobulin with papain, or a fragment having the same structure that is produced

synthetically, *e.g.*, by recombinant methods. A Fab fragment contains a light chain (containing a V_L and C_L) and another chain containing a variable domain of a heavy chain (V_H) and one constant region domain of the heavy chain (C_{H1}).

[0142] A “F(ab')₂ fragment” is an antibody fragment that results from digestion of an immunoglobulin with pepsin at pH 4.0-4.5, or a fragment having the same structure that is produced synthetically, *e.g.*, by recombinant methods. The F(ab')₂ fragment essentially contains two Fab fragments where each heavy chain portion contains an additional few amino acids including cysteine residues that form disulfide linkages joining the two fragments.

[0143] A “Fab' fragment” is a fragment containing one half (one heavy chain and one light chain) of the F(ab')₂ fragment.

[0144] An “Fd' fragment” is a fragment of an antibody containing one heavy chain portion of a F(ab')₂ fragment.

[0145] An “Fv' fragment” is a fragment containing only the V_H and V_L domains of an antibody molecule.

[0146] An “scFv fragment” refers to an antibody fragment that contains a variable light chain (V_L) and variable heavy chain (V_H), covalently connected by a polypeptide linker in any order. The linker is of a length such that the two variable domains are bridged without substantial interference. Exemplary linkers are (Gly-Ser)_n residues with some Glu or Lys residues dispersed throughout to increase solubility.

[0147] “Diabodies” are dimeric scFv; diabodies typically have shorter peptide linkers than scFvs, and preferentially dimerize.

[0148] The term “immunological activity” as used herein refers to one or more activities of immune cells, such as T cells or B cells, including, for example, activation, cell survival, cell proliferation, cytokine production (*e.g.* interferon-gamma), cytotoxicity activity, or ability to activate NF- κ B pathway or other signaling cascade leading to activation of a transcription factor in the immune cell. Assays to assess immunological activity of immunomodulatory proteins can be compared to control proteins with a known activity.

[0149] An “immunomodulatory protein” or “immunomodulatory polypeptide” is a protein that modulates immunological activity. By “modulation” or “modulating” an immune response is meant that immunological activity is either enhanced or suppressed. Such modulation includes any induction, or alteration in degree or extent, or suppression of immunological activity of an immune cell, such as a B cell or a T cell. For example, soluble Fc fusion proteins herein may suppress immunological activity of B cells. An immunomodulatory protein can be a

single polypeptide chain or a multimer (dimers or higher order multimers) of at least two polypeptide chains covalently bonded to each other by, for example, interchain disulfide bonds. Thus, monomeric, dimeric, and higher order multimeric proteins are within the scope of the defined term. Multimeric proteins can be homomultimeric (of identical polypeptide chains) or heteromultimeric (of different polypeptide chains).

[0150] As used herein, modification is in reference to modification of a sequence of amino acids of a polypeptide or a sequence of nucleotides in a nucleic acid molecule and includes a change in amino acids or nucleotides, respectively, of the sequence. The amino acid modification or change may be a deletion, insertion, or replacement (substitution) of amino acids or nucleotides, respectively. Methods of modifying a polypeptide are routine to those of skill in the art, such as by using recombinant DNA methodologies.

[0151] The term, a “multimerization domain” refers to a sequence of amino acids that promotes the formation of a multimer of two or more polypeptides. A multimerization domain includes sequences that promote stable interaction of a polypeptide molecule with one or more additional polypeptide molecules, each containing a complementary multimerization domain (e.g. a first multimerization domain and a second multimerization domain), which can be the same or a different multimerization domain. The interactions between complementary multimerization domains, e.g. interaction between a first multimerization domain and a second multimerization domain, form a stable protein-protein interaction to produce a multimer of the polypeptide molecule with the additional polypeptide molecule. In some cases, the multimerization domain is the same and interacts with itself to form a stable protein-protein interaction between two polypeptide chains. Generally, a polypeptide is joined directly or indirectly to the multimerization domain. Exemplary multimerization domains include the immunoglobulin sequences or portions thereof, leucine zippers, hydrophobic regions, hydrophilic regions, and compatible protein-protein interaction domains. The multimerization domain, for example, can be an immunoglobulin constant region or domain, such as, for example, the Fc domain or portions thereof from IgG, including IgG1, IgG2, IgG3 or IgG4 subtypes, IgA, IgE, IgD and IgM and modified forms thereof.

[0152] The terms “nucleic acid” and “polynucleotide” are used interchangeably to refer to a polymer of nucleic acid residues (e.g., deoxyribonucleotides or ribonucleotides) in either single- or double-stranded form. Unless specifically limited, the terms encompass nucleic acids containing known analogues of natural nucleotides and that have similar binding properties to it and are metabolized in a manner similar to naturally-occurring nucleotides. Unless otherwise

indicated, a particular nucleic acid sequence also implicitly encompasses conservatively modified variants thereof (e.g., degenerate codon substitutions) and complementary nucleotide sequences as well as the sequence explicitly indicated. Specifically, degenerate codon substitutions may be achieved by generating sequences in which the third position of one or more selected (or all) codons is substituted with mixed-base and/or deoxyinosine residues. The term nucleic acid or polynucleotide encompasses cDNA or mRNA encoded by a gene.

[0153] The terms “in operable combination,” “in operable order” and “operably linked” as used herein refer to the linkage of nucleic acid sequences in such a manner or orientation that the segments are arranged so that they function in concert for their intended purposes. In some embodiments, the term refers to linkage of nucleic acids to produce a nucleic acid molecule capable of directing the transcription of a given gene and/or to produce a desired protein molecule that is functional. For example, segments of a DNA sequence, e.g. a coding sequence and a regulatory sequence(s), are linked in such a way as to permit gene expression when the appropriate molecules (e.g. transcriptional activator proteins) are bound to the regulatory sequence.

[0154] The term “pharmaceutical composition” refers to a composition suitable for pharmaceutical use in a mammalian subject, often a human. A pharmaceutical composition typically comprises an effective amount of an active agent (e.g., an immunomodulatory protein) and a carrier, excipient, or diluent. The carrier, excipient, or diluent is typically a pharmaceutically acceptable carrier, excipient or diluent, respectively.

[0155] The terms “polypeptide” and “protein” are used interchangeably herein and refer to a molecular chain of two or more amino acids linked through peptide bonds. The terms do not refer to a specific length of the product. Thus, “peptides,” and “oligopeptides,” are included within the definition of polypeptide. The terms include post-translational modifications of the polypeptide, for example, glycosylations, acetylations, phosphorylations and the like. The terms also include molecules in which one or more amino acid analogs or non-canonical or unnatural amino acids are included as can be synthesized, or expressed recombinantly using known protein engineering techniques. In addition, proteins can be derivatized as described herein by well-known organic chemistry techniques.

[0156] The term “purified” as applied to nucleic acids, such as encoding immunomodulatory proteins, or proteins (e.g. immunomodulatory proteins) generally denotes a nucleic acid or polypeptide that is substantially free from other components as determined by analytical techniques well known in the art (e.g., a purified polypeptide or polynucleotide forms a discrete

band in an electrophoretic gel, chromatographic eluate, and/or a media subjected to density gradient centrifugation). For example, a nucleic acid or polypeptide that gives rise to essentially one band in an electrophoretic gel is “purified.” A purified nucleic acid or protein is at least about 50% pure, usually at least about 75%, 80%, 85%, 90%, 95%, 96%, 99% or more pure (e.g., percent by weight or on a molar basis).

[0157] The term “recombinant” indicates that the material (e.g., a nucleic acid or a polypeptide) has been artificially (i.e., non-naturally) altered by human intervention. The alteration can be performed on the material within, or removed from, its natural environment or state. For example, a “recombinant nucleic acid” is one that is made by recombining nucleic acids, e.g., during cloning, affinity modification, DNA shuffling or other well-known molecular biological procedures. A “recombinant DNA molecule,” is comprised of segments of DNA joined together by means of such molecular biological techniques. The term “recombinant protein” or “recombinant polypeptide” as used herein refers to a protein molecule (e.g., an immunomodulatory protein) which is expressed using a recombinant DNA molecule. A “recombinant host cell” is a cell that contains and/or expresses a recombinant nucleic acid or that is otherwise altered by genetic engineering, such as by introducing into the cell a nucleic acid molecule encoding a recombinant protein, such as a immunomodulatory protein provided herein. Transcriptional control signals in eukaryotes comprise “promoter” and “enhancer” elements. Promoters and enhancers consist of short arrays of DNA sequences that interact specifically with cellular proteins involved in transcription. Promoter and enhancer elements have been isolated from a variety of eukaryotic sources including genes in yeast, insect and mammalian cells and viruses (analogous control elements, i.e., promoters, are also found in prokaryotes). The selection of a particular promoter and enhancer depends on what cell type is to be used to express the protein of interest.

[0158] The term “recombinant expression vector” as used herein refers to a DNA molecule containing a desired coding sequence (e.g., encoding an immunomodulatory protein) and appropriate nucleic acid sequences necessary for the expression of an operably linked coding sequence in a particular cell. Nucleic acid sequences necessary for expression in prokaryotes include a promoter, optionally an operator sequence, a ribosome binding site and possibly other sequences. Eukaryotic cells are known to utilize promoters, enhancers, and termination and polyadenylation signals. A secretory signal peptide sequence can also, optionally, be encoded by the recombinant expression vector, operably linked to the coding sequence so that the expressed protein can be secreted by the recombinant host cell, such as for its expression as a

secretable protein or for more facile isolation or purification of the immunomodulatory protein from the cell, if desired. The term includes the vector as a self-replicating nucleic acid structure as well as the vector incorporated into the genome of a host cell into which it has been introduced. Among the vectors are viral vectors, such as lentiviral vectors.

[0159] The term “sequence identity” as used herein refers to the sequence identity between genes or proteins at the nucleotide or amino acid level, respectively. “Sequence identity” is a measure of identity between proteins at the amino acid level and a measure of identity between nucleic acids at nucleotide level. The protein sequence identity may be determined by comparing the amino acid sequence in a given position in each sequence when the sequences are aligned. Similarly, the nucleic acid sequence identity may be determined by comparing the nucleotide sequence in a given position in each sequence when the sequences are aligned. Methods for the alignment of sequences for comparison are well known in the art, such methods include GAP, BESTFIT, BLAST, BLAST-2, ALIGN or Megalign (DNASTAR) software, FASTA and TFASTA. The BLAST algorithm calculates percent sequence identity and performs a statistical analysis of the similarity between the two sequences. The software for performing BLAST analysis is publicly available through the National Center for Biotechnology Information (NCBI) website. In some cases, a percent sequence identity can be determined as the percentage of amino acid residues (or nucleotide residues) in a candidate sequence that are identical with the amino acid residues (or nucleotide residues) in a reference sequence, after aligning the sequences and introducing gaps, if necessary, to achieve the maximum percent sequence identity. Reference to sequence identity includes sequence identity across the full length of each of the sequences being compared. Those skilled in the art can determine appropriate parameters for aligning sequences, including any algorithms needed to achieve maximal alignment over the full length of the sequences being compared.

[0160] The term “soluble” as used herein in reference to proteins means that the protein is not a membrane protein or is not anchored in a cell membrane. A protein can be constructed as a soluble protein by inclusion of only an extracellular domain or a portion thereof and without a transmembrane domain. In some cases, solubility of a protein can be improved by linkage or attachment, directly or indirectly via a linker, to an Fc domain or other half-life extending molecule, which, in some cases, also can improve the stability and/or half-life of the protein. In some aspects, a soluble protein is an Fc fusion protein.

[0161] The term “specifically binds” as used herein means the ability of a protein, under specific binding conditions, to bind to a target protein such that its affinity or avidity is at least

10 times as great, but optionally 50, 100, 250 or 500 times as great, or even at least 1000 times as great as the average affinity or avidity of the same protein to a collection of random peptides or polypeptides of sufficient statistical size. A specifically binding protein need not bind exclusively to a single target molecule but may specifically bind to more than one target molecule. In some cases, a specifically binding protein may bind to a protein that has similarity in structural conformation with the target protein (e.g., paralogs or orthologs). Those of skill will recognize that specific binding to a molecule having the same function in a different species of animal (i.e., ortholog) or to a molecule having a substantially similar epitope as the target molecule (e.g., paralog) is possible and does not detract from the specificity of binding which is determined relative to a statistically valid collection of unique non-targets (e.g., random polypeptides). Thus, an immunomodulatory protein of the invention may specifically bind to more than one distinct species of target molecule due to cross-reactivity. Solid-phase ELISA immunoassays, ForteBio Octet or Biacore measurements can be used to determine specific binding between two proteins. Generally, interactions between two binding proteins have dissociation constants (K_d) less than about 1×10^{-5} M, and often as low as about 1×10^{-12} M. In certain aspects of the present disclosure, interactions between two binding proteins have dissociation constants of less than about 1×10^{-6} M, 1×10^{-7} M, 1×10^{-8} M, 1×10^{-9} M, 1×10^{-10} M, or 1×10^{-11} M or less.

[0162] The term “specific binding fragment” or “fragment” as used herein in reference to a protein means a polypeptide that is shorter than a full-length protein or a specific domain or region thereof and that specifically binds in vitro and/or in vivo to a binding partner of the full-length protein or of the specific domain or region. A specific finding fragment is in reference to a fragment of a full-length extracellular domain of a polypeptide or a binding domain of a polypeptide, but that still binds to a binding partner of the binding domain. For example, a specific binding fragment is in reference to a fragment of an extracellular domain of a full-length TNFR family member or a full-length TNFR domain (TD) thereof (e.g. CRD), but that still binds to a binding partner of the TNFR family member or of a CRD of an TNFR family member. In some embodiments, the specific binding fragment is at least about 20%, 30%, 40%, 50%, 60%, 70%, 75%, 80%, 85%, 90%, 95%, 96%, 97%, 98%, or 99% the sequence length of the full-length sequence of the extracellular domain or of a domain or region of the extracellular domain. In some embodiments, the specific binding fragment can have an amino acid length of at least 50 amino acids, such as at least 60, 70, 80, 90, 100, or 110 amino acids. In some

embodiments, the specific binding fragment includes the CRD1 and/or CRD2 domain. In some embodiments, the specific binding fragment includes the CRD2 domain.

[0163] As used herein, a “subject” is a mammal, such as a human or other animal, and typically is human. The subject can be male or female and can be any suitable age, including infant, juvenile, adolescent, adult, and geriatric subjects.

[0164] As used herein, “synthetic,” with reference to, for example, a synthetic nucleic acid molecule or a synthetic gene or a synthetic peptide refers to a nucleic acid molecule or polypeptide molecule that is produced by recombinant methods and/or by chemical synthesis methods.

[0165] The term “TNF receptor superfamily” or “TNFRSF” as used herein means the group of cell surface cytokine receptors that are all type I (N-terminus extracellular) transmembrane glycoproteins that contain one to six cysteine rich domains (CRD) in their extracellular domain. Molecules are categorized as members of this superfamily based on the shared structural features that include the one or more cysteine rich domain (CRD) present in their N-terminal extracellular region, which often play a role in protein binding of their cognate binding partner or ligand. A TNFRSF protein may have only one or several CRDs (e.g. CRD1, CRD2, etc.). Typically, ECD or ectodomain of TNFRSF members contain between 1 and 6 pseudorepeats of CRDs. For example, BAFF-receptor and BCMA each contain one CRD while TACI contains two CRDs (CRD1 and CRD2). TNFRSF members are usually trimeric or multimeric complexes that are stabilized by their intracysteine disulfide bonds. Binding of TNFRSF proteins to their ligands facilitates various biological activities in cells, such as the induction of apoptotic cell death or cell survival and proliferation.

[0166] The term “TD” refers to a structural domain or domains of TNFRSF proteins or of TNF family ligands. For example, a TD of a TNFRSF protein is a cysteine-rich domain (CRD) module of about 40 amino acids containing six (6) conserved cysteines. Hence, reference to CRD also can be used interchangeably with the term TD in reference to a TD of a TNFRSF protein. The six cysteines are involved in formation of intrachain disulphide bonds. The extracellular domain (ECD) of TNFRSF members contains one or more CRD domains; hence, the term TD is also used with reference to the ECD of such protein molecules. Reference to a variant TD (vTD) refers to a variant or modified sequence of a TD.

[0167] The term “trans” with reference to binding to cell surface molecules refers to binding to two different cell surface molecules, each of which is present on the surface of a different cell. In some embodiments, trans means that with respect to two different cell surface molecules, the

first is exclusively present on one of the two mammalian cells forming the IS and the second is present exclusively on the second of the two mammalian cells forming the IS.

[0168] The term “transmembrane protein” as used herein means a membrane protein that substantially or completely spans a lipid bilayer such as those lipid bilayers found in a biological membrane such as a mammalian cell, or in an artificial construct such as a liposome. The transmembrane protein comprises a transmembrane domain (“transmembrane domain”) by which it is integrated into the lipid bilayer and by which the integration is thermodynamically stable under physiological conditions. Transmembrane domains are generally predictable from their amino acid sequence via any number of commercially available bioinformatics software applications on the basis of their elevated hydrophobicity relative to regions of the protein that interact with aqueous environments (e.g., cytosol, extracellular fluid). A transmembrane domain is often a hydrophobic alpha helix that spans the membrane. A transmembrane protein can pass through both layers of the lipid bilayer once or multiple times.

[0169] The terms “treating,” “treatment,” or “therapy” of a disease, condition or disorder as used herein mean slowing, stopping or reversing the disease or disorders progression, as evidenced by decreasing, cessation or elimination of either clinical or diagnostic symptoms, by administration of an immunomodulatory protein or engineered cells of the present invention either alone or in combination with another compound as described herein. “Treating,” “treatment,” or “therapy” also means a decrease in the severity of symptoms in an acute or chronic disease, condition or disorder or a decrease in the relapse rate as for example in the case of a relapsing or remitting autoimmune disease course or inflammatory condition or a decrease in inflammation in the case of an inflammatory aspect of an autoimmune disease or inflammatory condition. “Preventing,” “prophylaxis,” or “prevention” of a disease, condition or disorder as used in the context of this invention refers to the administration of an immunomodulatory protein of the present invention, either alone or in combination with another compound, to prevent the occurrence or onset of a disease, condition or disorder or some or all of the symptoms of a disease, condition or disorder or to lessen the likelihood of the onset of a disease, condition or disorder.

[0170] The term “variant” (also “modified” or mutant,” which can be used interchangeably) as used in reference to a variant protein or polypeptide means a protein, such as a mammalian (e.g., human or murine) protein created by human intervention. The variant is a polypeptide having an altered or modified amino acid sequence, such as by one or more amino acid substitutions, deletions, additions or combinations thereof, relative to an unmodified or wild-

type protein or to a domain thereof. A variant polypeptide can contain 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30 or more amino acid differences, such as amino acid substitutions. A variant polypeptide generally exhibits at least about 50%, 60%, 70%, 80%, 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to a corresponding form of a wild-type or unmodified protein, such as a mature sequence thereof (lacking the signal sequence) or a portion thereof containing the extracellular domain or an binding domain thereof. Non-naturally occurring amino acids as well as naturally occurring amino acids are included within the scope of permissible substitutions or additions. A variant protein is not limited to any particular method of making and includes, for example, chemical synthesis, recombinant DNA techniques, or combinations thereof. A variant protein of the invention specifically binds to at least one or more binding partners. In some embodiments, the altered amino acid sequence results in an altered (i.e., increased or decreased) binding activity, such as binding affinity or avidity, to the one or more binding partners. A variant protein may thus be an “affinity-modified” protein as described herein.

[0171] The term “wild-type” or “natural” or “native,” which are used interchangeably, as used herein is used in connection with biological materials such as nucleic acid molecules, proteins, host cells, and the like, that are found in nature and not modified by human intervention.

II. TACI IMMUNOMODULATORY PROTEINS AND VARIANT TACI POLYPEPTIDES

[0172] Provided herein are TACI immunomodulatory proteins that contain a portion of the extracellular domain (ECD) of the TACI receptor, or a variant thereof, that bind to at least one TACI cognate binding partner. Also provided herein are variant TACI polypeptides that exhibit altered (e.g. increased) binding activity or affinity for one or more of a TACI cognate binding partner. In some embodiments, the TACI cognate binding partner is one or more of BAFF or APRIL or is a BAFF/APRIL heterotrimer. The provided TACI immunomodulatory proteins and polypeptides include soluble fusion proteins thereof in which the TACI portion of the extracellular domain or variant thereof is linked to another moiety, such as an immunoglobulin Fc or other multimerization domain or half-life extending moiety. Thus, in some embodiments the immunomodulatory protein is a TACI-Fc fusion protein. In some embodiments, provided is a TACI-Fc fusion protein containing (1) a TACI polypeptide composed of the extracellular

domain of the TACI receptor or a portion thereof, or a variant TACI polypeptide thereof, that binds to at least one TACI cognate binding partner, and (2) an Fc domain. The TACI polypeptide or variant TACI polypeptide can be linked directly or indirectly (e.g. via a peptide linker) to the Fc domain.

[0173] TACI is a tumor necrosis factor receptor family member characterized by having an extracellular domain (ECD) containing cysteine-rich pseudo-repeat domains (CRDs). TACI is a membrane bound receptor, which has an extracellular domain containing two cysteine-rich pseudo-repeats (CRD1 and CRD2), a transmembrane domain and a cytoplasmic domain that interacts with CAML (calcium-modulator and cyclophilin ligand), an integral membrane protein located at intracellular vesicles which is a co-inducer of NF-AT activation when overexpressed in Jurkat cells. TACI is associated with B cells and a subset of T cells. The TACI receptor binds two members of the tumor necrosis factor (TNF) ligand family. One ligand is designated BAFF (B cell Activating Factor of the TNF Family), and also is variously designated as ZTNF4, “neutrokin- α ,” “BLyS,” “TALL-1,” and “THANK” (Yu et al., international publication No. WO98/18921 (1998), Moore et al., *Science* 285:269 (1999); Mukhopadhyay et al., *J. Biol. Chem.* 274:15978 (1999); Schneider et al., *J. Exp. Med.* 189:1747 (1999); Shu et al., *J. Leukoc. Biol.* 65:680 (1999)). The other ligand has been designated as APRIL, and also is variously designated as “ZTNF2” and “TNRF death ligand-1” (Hahne et al., *J. Exp. Med.* 188:1185 (1998); Kelly et al., *Cancer Res.* 60:1021 (2000)). Both ligands are also bound by the B-cell maturation receptor (BCMA) (Gross et al., *Nature* 404:995 (2000)). Binding of TACI receptor to its ligands BAFF or APRIL stimulates B cell responses, including T cell-independent B cell antibody responses, isotype switching, and B cell homeostasis.

[0174] The amino acid sequence of full-length TACI is set forth in SEQ ID NO:88. The protein is a type III membrane protein and lacks a signal peptide; following expression in eukaryotic cells the N-terminal methionine is removed. In some embodiments, a mature TACI protein does not contain the N-terminal methionine as set forth in SEQ ID NO:88. The extracellular domain of TACI (amino acid residues 1-166 of SEQ ID NO:88; ECD set forth in SEQ ID NO:122) contains two cysteine rich domain (CRDs, hereinafter also called a tumor necrosis family receptor domain or TD), each of which exhibit affinity for binding to BAFF and APRIL. The first cysteine rich domain (CRD1) contains amino acid residues 34-66 of the sequence set forth in SEQ ID NO:122. The second cysteine rich domain (CRD2) corresponds to amino acids 71-104 of the sequence set forth in SEQ ID NO:122. TACI also contains a stalk

region of about 60 amino acids following the second cysteine repeat in the extracellular domain, corresponding to amino acid residues 105 -165 of the sequence set forth in SEQ ID NO:122.

[0175] In some embodiments, the variant TACI polypeptides provided herein contain one or more amino acid modifications, such as one or more substitutions (alternatively, “mutations” or “replacements”), deletions or additions in the extracellular domain of a reference TACI polypeptide, such as a wild-type or unmodified TACI polypeptide containing a CRD(s) (hereinafter also called TDs). Thus, a provided variant TACI polypeptide is or comprises a variant TD (“vTD”) in which the one or more amino acid modifications (e.g. substitutions) is in a CRD. In some embodiments, the one or more amino acids modifications, such as one or more substitutions (alternatively, “mutations” or “replacements”), deletions or additions, is in the CRD1 region. In some embodiments, the one or more amino acids modifications, such as one or more substitutions (alternatively, “mutations” or “replacements”), deletions or additions, is in the CRD2 region. In some embodiments, the one or more amino acids modifications, such as one or more substitutions (alternatively, “mutations” or “replacements”), deletions or additions, is in amino acids within both the CRD1 and CRD2 regions.

[0176] In some embodiments, the reference (e.g. unmodified) TACI sequence is a wild-type TACI sequence or is a portion thereof that contains one or both CRDs. In some embodiments, the reference (e.g., unmodified) TACI is or comprises the extracellular domain (ECD) of TACI or a portion thereof containing one or both CRD domains. In some embodiments, the extracellular domain of a reference (e.g., unmodified) TACI polypeptide comprises a CRD1 and CRD2. However, the variant TACI polypeptide need not comprise both the CRD1 and the CRD2. In some embodiments, the variant TACI polypeptide comprises or consists essentially of the CRD1 or a specific binding fragment thereof. In some embodiments, the variant TACI polypeptide comprises or consists essentially of the CRD2 or specific binding fragments thereof. In some embodiments, the variant TACI is a soluble polypeptide and lacks a transmembrane domain. In some embodiments, the variant TACI polypeptide further comprises a transmembrane domain and, in some cases, also a cytoplasmic domain.

[0177] In some embodiments, the reference (e.g., unmodified) TACI sequence is a mammalian TACI sequence. In some embodiments, the reference (e.g., unmodified) TACI sequence can be a mammalian TACI that includes, but is not limited to, human, mouse, cynomolgus monkey, or rat. In some embodiments, the reference (e.g., unmodified) TACI sequence is human. The extracellular domain of an exemplary human TACI sequence is set forth in SEQ ID NO:122.

[0178] In some embodiments, the reference (e.g., unmodified) TACI sequence has (i) the sequence of amino acids set forth in SEQ ID NO:122 or a sequence thereof that lacks the N-terminal methionine, (ii) a sequence of amino acids that exhibits at least about 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to SEQ ID NO:122 and that binds to APRIL, BAFF or an APRIL/BAFF heterotrimer, or (iii) is a fragment or portion of (i) or (ii) containing a CRD1 and/or CRD2, in which the portion binds to APRIL, BAFF or an APRIL/BAFF heterotrimer. In some embodiments, the reference (e.g., unmodified) TACI sequence lacks the N-terminal methionine as set forth in SEQ ID NO: 122.

[0179] In some embodiments, the reference (e.g. unmodified) TACI sequence is an extracellular domain sequence of TACI that is a portion of the ECD that contains an N-terminal deletion relative to the sequence of amino acids set forth in SEQ ID NO:122. In some embodiments, the N-terminal deletion is deletion of N-terminal amino acid residues 1-28 corresponding to residues set forth in SEQ ID NO:122. In some embodiments, the N-terminal deletion is deletion of N-terminal amino acid residues 1-29 corresponding to residues set forth in SEQ ID NO:122. In some embodiments, the N-terminal deletion is deletion of N-terminal amino acid residues 1-30 corresponding to residues set forth in SEQ ID NO:122. In some embodiments, the N-terminal deletion is deletion of N-terminal amino acid residues 1-31 corresponding to residues set forth in SEQ ID NO:122. In some embodiments, the N-terminal deletion is deletion of N-terminal amino acid residues 1-32 corresponding to residues set forth in SEQ ID NO:122. In some embodiments, the N-terminal deletion is deletion of N-terminal amino acid residues 1-33 corresponding to residues set forth in SEQ ID NO:122.

[0180] In embodiments of any of the provided embodiments, the reference (e.g. unmodified) TACI sequence is an ECD portion that contains deletion of one or more residues of the stalk portion of the TACI extracellular domain. In some embodiments, the reference (e.g. unmodified) TACI sequence is an ECD portion that lacks one or more contiguous C-terminal amino acid residues beginning at residue 105 and up to or including amino acid residue 166

corresponding to residues of the ECD sequence set forth in SEQ ID NO:122. In some embodiments, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61 or 62 of the ECD sequence is deleted.

[0181] In some embodiments, the reference (e.g. unmodified) TACI sequence contains an ECD portion having a contiguous sequence of amino acids that includes the CRD1 and/or CRD2 (e.g. CRD1 and CRD2 or CRD2 only) and only a segment or portion of the stalk sequence.

Suitable stalk segments include one or more amino acids of amino acid residues 105 to 154 of SEQ ID NO:122. For example, the stalk segment can consist of the following with reference to SEQ ID NO:122: amino acid residue 105, amino acid residues 105 to 106, amino acid residues 105 to 107, amino acid residues 105 to 108, amino acid residues 105 to 109, amino acid residues 105 to 110, amino acid residues 105 to 111, amino acid residues 105 to 112, amino acid residues 105 to 113, amino acid residues 105 to 114, amino acid residues 105 to 115, amino acid residues 105 to 116, amino acid residues 105 to 117, amino acid residues 105 to 118, amino acid residues 105 to 119, amino acid residues 105 to 120, amino acid residues 105 to 121, amino acid residues 105 to 122, amino acid residues 105 to 123, amino acid residues 105 to 124, amino acid residues 105 to 125, amino acid residues 105 to 126, amino acid residues 105 to 127, amino acid residues 105 to 128, amino acid residues 105 to 129, amino acid residues 105 to 130, amino acid residues 105 to 131, amino acid residues 105 to 132, amino acid residues 105 to 133, amino acid residues 105 to 134, amino acid residues 105 to 135, amino acid residues 105 to 136, amino acid residues 105 to 137, amino acid residues 105 to 138, amino acid residues 105 to 139, amino acid residues 105 to 140, amino acid residues 105 to 141, amino acid residues 105 to 142, amino acid residues 105 to 143, amino acid residues 105 to 144, amino acid residues 105 to 145, amino acid residues 105 to 146, amino acid residues 105 to 147, amino acid residues 105 to 148, amino acid residues 105 to 149, amino acid residues 105 to 150, amino acid residues 105 to 151, amino acid residues 105 to 152, amino acid residues 105 to 153, and amino acid residues 105 to 154.

[0182] In some embodiments, the reference (e.g. unmodified) TACI sequence lacks or is mutated in one or more potential furin cleavage sites. In some cases, the reference (e.g. unmodified) TACI sequence is an ECD or portion that in which the arginine residue at position 119 is mutated, e.g. R119G. In some cases, the reference (e.g. unmodified) TACI sequence is an ECD or portion that in which the glutamine residue at position 121 is mutated, e.g. Q121P. In some cases, the reference (e.g. unmodified) TACI sequence is an ECD or portion that in which the arginine residue at position 122 is mutated, e.g. R122Q.

[0183] In some embodiments, the reference TACI sequence is a TACI ECD sequence as set forth in international PCT publication No. WO2000/067034, WO2002/094852 or WO2008/154814.

[0184] In some embodiments, the reference TACI sequence is a TACI ECD sequence that has or consists of the sequence set forth in SEQ ID NO:131.

[0187] In some embodiments, the reference TACI sequence is an extracellular domain region of TACI that consists essentially of only the CRD2 sequence and that is deleted in or lacks the entirety of the sequence of the CRD1 and substantially all of the stalk region. Although previous studies have shown that residues in the stalk region may contain a protease cleavage site, it was believed that at least the CRD1 and CRD2 was required for sufficient expression and/or binding activity of TACI for its cognate ligands. For example, international PCT publication No. WO2002/094852 demonstrated that a TACI molecule containing a CRD1

and CRD2, but in which the whole amino terminal region and a partial sequence of the stalk region was deleted, exhibited reduced protein degradation when expressed. Other studies showed that at least a portion of the N-terminal region before the CRD1 was necessary for sufficient binding activity of TACI for its cognate ligands, see e.g. international publication No. WO2008/154814, in which residues 13-118 or 13-108 of the TACI extracellular region were determined to be necessary for biological activity while minimizing degradation of TACI during expression. Surprisingly, it is found herein (e.g. Example 3) that a TACI extracellular region that consists essentially only of the CRD2 with a small portion of the stalk region exhibits substantially improved cognate binding activity compared to a longer TACI molecule containing both the CRD1 and CRD2.

[0188] Provided herein is an immunomodulatory protein (e.g. TACI-Fc fusion protein) containing a TACI polypeptide that is a portion of the TACI extracellular domain (ECD) region that contains the CRD2, with a deletion of the N-terminal region and CRD1 and deletion of one or more residues of the stalk portion of the TACI extracellular domain, e.g. relative to the sequence of amino acids set forth in SEQ ID NO:122. In some embodiments, the portion of the TACI extracellular domain that contains the CRD2 includes amino acid residues 71-104 corresponding to residues set forth in SEQ ID NO:122. In provided embodiments, the TACI polypeptide of the immunomodulatory protein contains deletion of N-terminal amino acid residues 1-66 corresponding to residues set forth in SEQ ID NO:122. In provided embodiments, the TACI polypeptide of the immunomodulatory protein contains deletion of N-terminal amino acid residues 1-67 corresponding to residues set forth in SEQ ID NO:122. In provided embodiments, the TACI polypeptide of the immunomodulatory protein contains deletion of N-terminal amino acid residues 1-68 corresponding to residues set forth in SEQ ID NO:122. In provided embodiments, the TACI polypeptide of the immunomodulatory protein contains deletion of N-terminal amino acid residues 1-69 corresponding to residues set forth in SEQ ID NO:122. In provided embodiments, the TACI polypeptide of the immunomodulatory protein contains deletion of N-terminal amino acid residues 1-70 corresponding to residues set forth in SEQ ID NO:122. In embodiments of any such embodiments, the TACI polypeptide of the immunomodulatory protein lacks one or more contiguous C-terminal amino acid residues beginning at residue 105 and up to or including amino acid residue 166 corresponding to residues of the ECD sequence set forth in SEQ ID NO:122. In some embodiments, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32,

33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61 or 62 of the ECD sequence is deleted.

[0189] In some embodiments, an immunomodulatory protein (e.g. TACI-Fc fusion protein) provided herein has a TACI polypeptide with a sequence that contains an ECD portion having a contiguous sequence of amino acids of a TACI ECD that includes the CRD2 (e.g. residues 71-104 with reference to SEQ ID NO:122), but with a deletion of the N-terminal region and CRD1 and deletion of one or more residues of the stalk portion of the TACI extracellular domain, e.g. relative to the sequence of amino acids set forth in SEQ ID NO:122. For example, the TACI ECD portion can consist of the following with reference to amino acid residues set forth in SEQ ID NO:122: amino acid residues 67 to 118, amino acid residues 67 to 117, amino acid residues 67 to 116, amino acid residues 67 to 115, amino acid residues 67 to 114, amino acid residues 67 to 113, amino acid residues 67 to 112, amino acid residues 67 to 111, amino acid residues 67 to 110, amino acid residues 67 to 109, amino acid residues 67 to 108, amino acid residues 67 to 107, amino acid residues 67 to 106, amino acid residues 67 to 105, or amino acid residues 67 to 104. In some examples, the TACI ECD portion can consist of the following with reference to residues set forth in SEQ ID NO: 122: amino acid residues 68 to 118, amino acid residues 68 to 117, amino acid residues 68 to 116, amino acid residues 68 to 115, amino acid residues 68 to 114, amino acid residues 68 to 113, amino acid residues 68 to 112, amino acid residues 68 to 111, amino acid residues 68 to 110, amino acid residues 68 to 109, amino acid residues 68 to 108, amino acid residues 68 to 107, amino acid residues 68 to 106, amino acid residues 68 to 105, or amino acid residues 68 to 104. In some examples, the TACI ECD portion can consist of the following with reference to residues set forth in SEQ ID NO: 122: amino acid residues 69 to 118, amino acid residues 69 to 117, amino acid residues 69 to 116, amino acid residues 69 to 115, amino acid residues 69 to 114, amino acid residues 69 to 113, amino acid residues 69 to 112, amino acid residues 69 to 111, amino acid residues 69 to 110, amino acid residues 69 to 109, amino acid residues 69 to 108, amino acid residues 69 to 107, amino acid residues 69 to 106, amino acid residues 69 to 105, or amino acid residues 69 to 104. In some examples, the TACI ECD portion can consist of the following with reference to residues set forth in SEQ ID NO: 122: amino acid residues 70 to 118, amino acid residues 70 to 117, amino acid residues 70 to 116, amino acid residues 70 to 115, amino acid residues 70 to 114, amino acid residues 70 to 113, amino acid residues 70 to 112, amino acid residues 70 to 111, amino acid residues 70 to 110, amino acid residues 70 to 109, amino acid residues 70 to 108, amino acid residues 70 to 107, amino acid residues 70 to 106, amino acid residues 70 to 105, or amino acid residues 70 to

104. In some examples, the TACI ECD portion can consist of the following with reference to residues set forth in SEQ ID NO: 122: amino acid residues 71 to 118, amino acid residues 71 to 117, amino acid residues 71 to 116, amino acid residues 71 to 115, amino acid residues 71 to 114, amino acid residues 71 to 113, amino acid residues 71 to 112, amino acid residues 71 to 111, amino acid residues 71 to 110, amino acid residues 71 to 109, amino acid residues 71 to 108, amino acid residues 71 to 107, amino acid residues 71 to 106, amino acid residues 71 to 105, or amino acid residues 71 to 104. Any of the above TACI ECD sequences also can be a TACI reference sequence in accord with the immunomodulatory proteins provided herein, in which such immunomodulatory proteins contain a variant TACI polypeptide that is modified by one or more amino acid modification (e.g. substitution) as described herein compared to such TACI reference sequence.

[0190] In particular, among TACI polypeptides provided herein is a TACI ECD sequence that has or consists of the sequence set forth in SEQ ID NO:13 (encoded by the sequence of nucleotides set forth in SEQ ID NO:48). In some embodiments, the reference TACI sequence has or consists of the sequence set forth in SEQ ID NO:13, in which a provided variant TACI polypeptide is modified by one or more amino acid modification (e.g. substitution) as described herein compared to such reference TACI sequence.

TACI ECD sequence (CRD2): SEQ ID NO:13

SLSCRKEQGKFYDHLRLDCISCASICGQHPKQCAYFCENKLRS

[0191] Among provided TACI polypeptides are variant TACI polypeptides. Also provided are immunomodulatory proteins, such as TACI-Fc fusion proteins, that contain a provided variant TACI polypeptide. In embodiments of any of the provided embodiments, the variant TACI sequence has the sequence of the reference (e.g. unmodified) TACI sequence, such as any described above, but additionally contains one more amino acid modifications, such as one or more amino acid substitutions. In particular, provided herein are variant TACI polypeptides containing at least one affinity-modified TD domain (e.g., CRD1 and/or CRD2) or a specific binding fragment thereof that contains one or more amino acid substitutions in a TD domain of a reference (e.g., unmodified or wild-type) TACI polypeptide, such that the variant TACI polypeptide exhibits altered (e.g. increased) binding activity or affinity for one or both of APRIL or BAFF compared to the reference (e.g., unmodified or wild-type) TACI polypeptide. In some embodiments, a variant TACI polypeptide has a binding affinity for APRIL and/or BAFF that

differs from that of a reference (e.g., unmodified or wild-type) TACI polypeptide control sequence as determined by, for example, solid-phase ELISA immunoassays, flow cytometry or Biacore assays. Binding affinities for each of the cognate binding partners are independent; that is, in some embodiments, a variant TACI polypeptide has an increased binding affinity for one or both APRIL and BAFF, and a decreased or unchanged binding affinity for the other of APRIL or BAFF, relative to a reference (e.g., unmodified or wild-type) TACI polypeptide.

[0192] In some embodiments, the variant TACI polypeptide has an increased binding affinity for BAFF, relative to the reference (unmodified or wild-type) TACI polypeptide. In some embodiments, the variant TACI polypeptide has an increased binding affinity for APRIL relative to the reference (unmodified or wild-type) TACI polypeptide. In some embodiments, the variant TACI polypeptide has an increased binding affinity for APRIL and BAFF relative to the reference (unmodified or wild-type) TACI polypeptide. The cognate ligands BAFF and/or APRIL can be a mammalian protein, such as a human protein or a murine protein. In particular embodiments, the cognate ligands BAFF and/or APRIL are human. In some embodiments, a variant TACI polypeptide with increased or greater binding affinity to APRIL and/or BAFF will have an increase in binding affinity relative to the reference (e.g., unmodified or wild-type) TACI polypeptide control of at least about 5%, such as at least about 10%, 15%, 20%, 25%, 35%, or 50%. In some embodiments, the increase in binding affinity relative to the reference (e.g., unmodified or wild-type) TACI polypeptide is more than about 1.2-fold, about 1.5-fold, about 2-fold, about 3-fold, about 4-fold, about 5-fold, about 6-fold, about 7-fold, about 8-fold, about 9-fold, about 10-fold, about 20-fold, about 30-fold, about 40-fold or about 50-fold. In any of the examples, the reference (e.g., unmodified or wild-type) TACI polypeptide has the same sequence as the variant TACI polypeptide except that it does not contain the one or more amino acid modifications (e.g., substitutions).

[0193] In some embodiments, the equilibrium dissociation constant (K_d) of any of the foregoing embodiments to BAFF can be less than 1×10^{-5} M, 1×10^{-6} M, 1×10^{-7} M, 1×10^{-8} M, 1×10^{-9} M, 1×10^{-10} M or 1×10^{-11} M, or 1×10^{-12} M. In some embodiments, the K_d of any of the foregoing embodiments to BAFF is less than at or about 1×10^{-9} M, 1×10^{-10} M or 1×10^{-11} M, or 1×10^{-12} M. In some embodiments, the K_d of any of the foregoing embodiments to BAFF is between 1×10^{-9} M and at or about 1×10^{-12} M. In some embodiments, the K_d of any of the foregoing embodiments to BAFF is at or about 1×10^{-9} M, at or about 2×10^{-9} M, at or about 4×10^{-9} M, at or about 6×10^{-9} M, at or about 8×10^{-9} M, at or about 1×10^{-10} M, at or about 2×10^{-10} M, at or about 4×10^{-10} M, at or about 6×10^{-10} M, at or about 8×10^{-10} M, at or about 1×10^{-11} M, at or

about 2×10^{-11} M, at or about 4×10^{-11} M, at or about 6×10^{-11} M, at or about 8×10^{-11} M, or at or about 1×10^{-12} M, or any value between any of the foregoing. In some embodiments, a provided embodiment includes a variant TACI polypeptide as described above and the K_d to BAFF is decreased (higher binding affinity) by greater than or greater than about 1.5-fold, such as greater than or about 2-fold, 3-fold, 4-fold, 5-fold, 6-fold, 7-fold, 8-fold, 9-fold, 10-fold or more.

[0194] In some embodiments, the equilibrium dissociation constant (K_d) of any of the foregoing embodiments to APRIL can be less than 1×10^{-5} M, 1×10^{-6} M, 1×10^{-7} M, 1×10^{-8} M, 1×10^{-9} M, 1×10^{-10} M or 1×10^{-11} M, or 1×10^{-12} M. In some embodiments, the K_d of any of the foregoing embodiments to APRIL is less than at or about 1×10^{-9} M, 1×10^{-10} M or 1×10^{-11} M, or 1×10^{-12} M. In some embodiments, the K_d of any of the foregoing embodiments to APRIL is between 1×10^{-9} M and at or about 1×10^{-12} M. In some embodiments, the K_d of any of the foregoing embodiments to APRIL is at or about 1×10^{-9} M, at or about 2×10^{-9} M, at or about 4×10^{-9} M, at or about 6×10^{-9} M, at or about 8×10^{-9} M, at or about 1×10^{-10} M, at or about 2×10^{-10} M, at or about 4×10^{-10} M, at or about 6×10^{-10} M, at or about 8×10^{-10} M, at or about 1×10^{-11} M, at or about 2×10^{-11} M, at or about 4×10^{-11} M, at or about 6×10^{-11} M, at or about 8×10^{-11} M, or at or about 1×10^{-12} M, or any value between any of the foregoing. In some embodiments, a provided embodiment includes a variant TACI polypeptide as described above and the K_d to APRIL is decreased (higher binding affinity) by greater than or greater than about 1.5-fold, such as greater than or about 2-fold, 3-fold, 4-fold, 5-fold, 6-fold, 7-fold, 8-fold, 9-fold, 10-fold or more.

[0195] The reference (e.g., unmodified or wild-type) TACI sequence does not necessarily have to be used as a starting composition to generate variant TACI polypeptides described herein. Therefore, use of the term “modification”, such as “substitution” does not imply that the present embodiments are limited to a particular method of making variant TACI polypeptides or immunomodulatory proteins containing the same. Variant TACI polypeptides can be made, for example, by *de novo* peptide synthesis and thus does not necessarily require a modification, such as a “substitution”, in the sense of altering a codon to encode for the modification, e.g. substitution. This principle also extends to the terms “addition” and “deletion” of an amino acid residue which likewise do not imply a particular method of making. The means by which the variant TACI polypeptides are designed or created is not limited to any particular method. In some embodiments, however, a reference (e.g., unmodified or wild-type) TACI encoding nucleic acid is mutagenized from reference (e.g., unmodified or wild-type) TACI genetic material and screened for desired specific binding affinity or other functional activity. In some embodiments, a variant TACI polypeptide is synthesized *de novo* utilizing protein or nucleic

acid sequences available at any number of publicly available databases and then subsequently screened. The National Center for Biotechnology Information provides such information, and its website is publicly accessible via the internet as is the UniProtKB database as discussed previously.

[0196] Unless stated otherwise, as indicated throughout the present disclosure, the amino acid modification(s) in a variant TACI polypeptide are designated by amino acid position number corresponding to the numbering of positions of the reference ECD sequence set forth in SEQ ID NO:122. It is within the level of a skilled artisan to identify the corresponding position of a modification, e.g. amino acid substitution, in an TACI polypeptide, including portion thereof containing TD (e.g. CRD1 and/or CRD2) thereof, such as by alignment of a reference sequence (e.g. SEQ ID NO:1 or 13) with SEQ ID NO:122. An alignment identifying corresponding residues is exemplified in FIG. 9. In the listing of modifications throughout this disclosure, the amino acid position is indicated in the middle, with the corresponding reference (e.g. unmodified or wild-type) amino acid listed before the number and the identified variant amino acid substitution listed after the number. If the modification is a deletion of the position a “del” is indicated and if the modification is an insertion at the position an “ins” is indicated. In some cases, an insertion is listed with the amino acid position indicated in the middle, with the corresponding reference amino acid listed before and after the number and the identified variant amino acid insertion listed after the unmodified (e.g. wild-type) amino acid.

[0197] In some embodiments, the variant TACI polypeptide has one or more amino acid modification, e.g. substitution in a reference (e.g., unmodified or wild-type) TACI sequence, such as any as described. The one or more amino acid modification, e.g. substitution, can be in the ectodomain (extracellular domain) of the reference (e.g., unmodified or wild-type) TACI sequence. In some embodiments, the one or more amino acid modification, e.g. substitution is in the CRD1 domain or specific binding fragment thereof. In some embodiments, the one or more amino acid modification, e.g. substitution is in the CRD2 domain or specific binding fragment thereof. In some embodiments of the variant TACI polypeptide, some of the one or more amino acid modification, e.g. substitution is in the CRD1 domain or a specific binding fragment thereof, and some of the one or more amino acid modification, e.g. substitution are in the CRD2 domain or a specific binding fragment thereof.

[0198] In some embodiments, the variant TACI polypeptide has up to 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, or 20 amino acid modification(s), e.g. substitution, in the reference TACI sequence. The modification, e.g. substitution can be in the CRD1 domain or the

CRD2 domain. In some embodiments, the variant TACI polypeptide has up to 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, or 20 amino acid substitutions in the CRD1 domain or specific binding fragment thereof of the reference TACI sequence. In some embodiments, the variant TACI polypeptide has up to 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, or 20 amino acid substitutions in the CRD2 domain or specific binding fragment thereof of the reference TACI sequence.

[0199] In some embodiments, the variant TACI polypeptide containing the one or more amino acid modifications (e.g. amino acid substitutions) as described has at least about 85%, 86%, 86%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity with the reference (e.g., unmodified or wild-type) TACI polypeptide set forth in SEQ ID NO:122 or specific binding fragment thereof containing the CRD1 and/or CRD2 domain. In some embodiments, the specific binding fragment contains the CRD1 domain, e.g. the specific binding fragment contains the sequence set forth as amino acids 34-66 of SEQ ID NO:122. In some cases, the CRD1 domain is the only full CRD domain in the specific binding fragment. In some embodiments, the specific binding fragment is or contains the CRD2 domain, e.g. the specific binding fragment contains the sequence set forth as amino acids 71-104 of SEQ ID NO:122. In some cases, the CRD2 domain is the only full CRD domain in the specific binding fragment. In some embodiments, the specific binding fragment is or contains the CRD1 domain and the CRD2 domain, e.g. the specific binding fragment contains amino acids 34-104 of SEQ ID NO:122. In some embodiments, the specific binding fragment contains a contiguous portion of the stalk domain, e.g. the specific binding fragment contains a contiguous portion of amino acids 105-165 of SEQ ID NO:122. In embodiments of any embodiments, the specific binding fragment of SEQ ID NO:122 is less than the full-length ECD set forth in SEQ ID NO:122. In some embodiments, the specific binding fragment is set forth in SEQ ID NO: 1. In some embodiments, the specific binding fragment is set forth in SEQ ID NO:13. In some embodiments, the specific binding fragment is set forth in SEQ ID NO: 130. In some embodiments, the specific binding fragment is set forth in SEQ ID NO:131.

[0200] In some embodiments, the variant TACI polypeptide containing the one or more amino acid modifications (e.g. amino acid substitutions) as described has at least about 85%, 86%, 86%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity with the reference (e.g., unmodified or wild-type) TACI polypeptide or specific binding fragment thereof, such as with the amino acid sequence of SEQ ID NO: 1, 13 or 122.

[0201] In some embodiments, the variant TACI polypeptide containing the one or more amino acid modifications (e.g. amino acid substitutions) as described has at least about 85%, 86%, 86%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity with the amino acid sequence of SEQ ID NO: 122.

[0202] In some embodiments, the variant TACI polypeptide containing the one or more amino acid modifications (e.g. amino acid substitutions) as described has at least about 85%, 86%, 86%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity with the amino acid sequence of SEQ ID NO: 1.

[0203] In some embodiments, the variant TACI polypeptide containing the one or more amino acid modifications (e.g. amino acid substitutions) as described has at least about 85%, 86%, 86%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity with the amino acid sequence of SEQ ID NO: 13.

[0204] In some embodiments, the variant TACI polypeptide containing the one or more amino acid modifications (e.g. amino acid substitutions) as described has at least about 85%, 86%, 86%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity with the amino acid sequence of SEQ ID NO: 130.

[0205] In some embodiments, the variant TACI polypeptide containing the one or more amino acid modifications (e.g. amino acid substitutions) as described has at least about 85%, 86%, 86%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, or 99% sequence identity with the amino acid sequence of SEQ ID NO: 131.

[0206] In some embodiments, the variant TACI polypeptide has one or more amino acid modification, e.g. substitution in a reference TACI polypeptide or specific binding fragment thereof corresponding to position(s) 40, 59, 60, 61, 74, 75, 76, 77, 78, 79, 82, 83, 84, 85, 86, 87, 88, 92, 95, 97, 98, 99, 101, 102 and 103 with reference to numbering of SEQ ID NO:122. In some embodiments, the variant TACI polypeptide has one or more amino acid modification, e.g. substitution selected from W40R, Q59R, R60G, T61P, E74V, Q75E, Q75R, G76S, K77E, F78Y, Y79F, L82H, L82P, L83S, R84G, R84L, R84Q, D85E, D85V, C86Y, I87L, I87M, S88N, I92V, Q95R, P97S, K98T, Q99E, A101D, Y102D, F103S, F103V, F103Y, or a conservative amino acid substitution thereof. In some embodiments, the reference TACI polypeptide includes the CRD1 domain or CRD2 domain, for example the reference TACI polypeptide is set forth in SEQ ID NO: 1 or SEQ ID NO:122.

[0207] In some embodiments, the amino acid substitutions are in the CRD2 domain only. In some embodiments, the variant TACI polypeptide has one or more amino acid modification, e.g.

substitution in a reference TACI polypeptide or specific binding fragment thereof corresponding to position(s) 74, 75, 76, 77, 78, 79, 82, 83, 84, 85, 86, 87, 88, 92, 95, 97, 98, 99, 101, 102 and 103 with reference to numbering of SEQ ID NO:122. In some embodiments, the variant TACI polypeptide has one or more amino acid modification, e.g. substitution selected from E74V, Q75E, Q75R, G76S, K77E, F78Y, Y79F, L82H, L82P, L83S, R84G, R84L, R84Q, D85E, D85V, C86Y, I87L, I87M, S88N, I92V, Q95R, P97S, K98T, Q99E, A101D, Y102D, F103S, F103V, F103Y, or a conservative amino acid substitution thereof. In some embodiments, among the CRD domains, the reference TACI polypeptide includes only the CRD2 domain but lacks the CRD1 domain, for example the reference TACI polypeptide is set forth in SEQ ID NO: 13. Accordingly, in some embodiments, the variant TACI polypeptide includes a portion of the ECD sequence of a TACI polypeptide that includes the CRD2 domain but lacks the CRD1 domain.

[0208] A conservative amino acid modification, e.g. substitution is any amino acid that falls in the same class of amino acids as the substituted amino acids, other than the reference (e.g., unmodified) or wild-type amino acid. The classes of amino acids are aliphatic (glycine, alanine, valine, leucine, and isoleucine), hydroxyl or sulfur-containing (serine, cysteine, threonine, and methionine), cyclic (proline), aromatic (phenylalanine, tyrosine, tryptophan), basic (histidine, lysine, and arginine), and acidic/amide (aspartate, glutamate, asparagine, and glutamine).

[0209] In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution at position 75 with reference to numbering of SEQ ID NO:122. In some embodiments, the amino acid substitution at position 75 confers increased binding to BAFF or APRIL compared to the reference (e.g. wildtype or unmodified) TACI polypeptide not containing the amino acid substitution. In some embodiments, the substituted amino acid is an acidic amino acid or amide, such as to a different acidic amino acid or amide compared to the reference (e.g. wildtype or unmodified) TACI polypeptide. In some embodiments, the substituted amino acid at position 75 is a glutamic acid (Glu, E). In some embodiments, the substituted amino acid at position 75 is an aspartic acid (Asp, D). In some embodiments, the substituted amino acid at position 75 is an asparagine (Asn, N). In some embodiments, the substituted amino acid at position 75 is a glutamine (Gln, Q).

[0210] In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution at position 77 with reference to numbering of SEQ ID NO:122. In some embodiments, the amino acid substitution at position 77 confers increased binding to BAFF or APRIL compared to the reference (e.g. wildtype or unmodified) TACI polypeptide not

containing the amino acid substitution. In some embodiments, the substituted amino acid at position 77 is an acidic amino acid or amide. In some embodiments, the substituted amino acid at position 77 is a glutamic acid (Glu, E). In some embodiments, the substituted amino acid at position 77 is an asparatic acid (Asp, D). In some embodiments, the substituted amino acid at position 77 is an asparagine (Asn, N). In some embodiments, the substituted amino acid at position 77 is a glutamine (Gln, Q).

[0211] In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution at position 78 with reference to numbering of SEQ ID NO:122. In some embodiments, the amino acid substitution at position 78 confers increased binding to BAFF or APRIL compared to the reference (e.g. wildtype or unmodified) TACI polypeptide not containing the amino acid substitution. In some embodiments, the substituted amino acid at position 78 is an aromatic amino acid, such as to a different aromatic amino acid compared to the reference (e.g. wildtype or unmodified) TACI polypeptide. In some embodiments, the substituted amino acid at position 78 is a phenylalanine (Phe, F). In some embodiments, the substituted amino acid at position 78 is a tyrosine (Tyr, Y). In some embodiments, the substituted amino acid at position 78 is a tryptophan (Trp, W).

[0212] In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution at position 84 with reference to numbering of SEQ ID NO:122. In some embodiments, the amino acid substitution at position 84 confers increased binding to BAFF or APRIL compared to the reference (e.g. wildtype or unmodified) TACI polypeptide not containing the amino acid substitution. In some embodiments, the substituted amino acid at position 84 is an acidic amino acid or amide. In some embodiments, the substituted amino acid at position 84 is a glutamic acid (Glu, E). In some embodiments, the substituted amino acid at position 84 is an asparatic acid (Asp, D). In some embodiments, the substituted amino acid at position 84 is an asparagine (Asn, N). In some embodiments, the substituted amino acid at position 84 is a glutamine (Gln, Q).

[0213] In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution at position 101 with reference to numbering of SEQ ID NO:122. In some embodiments, the amino acid substitution at position 101 confers increased binding to BAFF or APRIL compared to the reference (e.g. wildtype or unmodified) TACI polypeptide not containing the amino acid substitution. In some embodiments, the substituted amino acid at position 101 is an acidic amino acid or amide. In some embodiments, the substituted amino acid at position 101 is a glutamic acid (Glu, E). In some embodiments, the substituted amino acid at

position 101 is an asparatic acid (Asp, D). In some embodiments, the substituted amino acid at position 101 is an asparagine (Asn, N). In some embodiments, the substituted amino acid at position 101 is a glutamine (Gln, Q).

[0214] In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution at position 102 with reference to numbering of SEQ ID NO:122. In some embodiments, the amino acid substitution at position 102 confers increased binding to BAFF or APRIL compared to the reference (e.g. wildtype or unmodified) TACI polypeptide not containing the amino acid substitution. In some embodiments, the substituted amino acid at position 102 is an acidic amino acid or amide. In some embodiments, the substituted amino acid at position 102 is a glutamic acid (Glu, E). In some embodiments, the substituted amino acid at position 102 is an asparatic acid (Asp, D). In some embodiments, the substituted amino acid at position 102 is an asparagine (Asn, N). In some embodiments, the substituted amino acid at position 102 is a glutamine (Gln, Q).

[0215] In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution E74V. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution Q75E. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution K77E. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution F78Y. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution Y79F. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution L82H. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution L82P. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution R84G. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution R84L. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution R84Q. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution D85V. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution C86Y. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution A101D. In some embodiments, the variant TACI polypeptide includes at least one amino acid substitution Y102D. In some embodiments, the variant TACI polypeptide contains two or more amino acid substitutions of any two or more of the foregoing. In some embodiments, the variant TACI polypeptide includes one or more amino acid substitution that is a conservative amino acid substitution of any of the foregoing. In provided embodiments, the variant TACI polypeptide

includes the at least one amino acid substitution in any reference TACI polypeptide sequence as described. In some embodiments, the at least one amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 1. In some embodiments, the at least one amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 13. In some embodiments, the at least one amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 130. In some embodiments, the at least one amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 131.

[0216] In some embodiments, the variant TACI polypeptide includes the amino acid substitution E74V. In some embodiments, the variant TACI polypeptide includes the amino acid substitution Q75E. In some embodiments, the variant TACI polypeptide includes the amino acid substitution K77E. In some embodiments, the variant TACI polypeptide includes the amino acid substitution F78Y. In some embodiments, the variant TACI polypeptide includes the amino acid substitution Y79F. In some embodiments, the variant TACI polypeptide includes the amino acid substitution L82H. In some embodiments, the variant TACI polypeptide includes the amino acid substitution L82P. In some embodiments, the variant TACI polypeptide includes the amino acid substitution R84G. In some embodiments, the variant TACI polypeptide includes the amino acid substitution R84L. In some embodiments, the variant TACI polypeptide includes the amino acid substitution R84Q. In some embodiments, the variant TACI polypeptide includes the amino acid substitution D85V. In some embodiments, the variant TACI polypeptide includes the amino acid substitution C86Y. In some embodiments, the variant TACI polypeptide includes the amino acid substitution A102D. In some embodiments, the variant TACI polypeptide includes the amino acid substitution Y102D. In some embodiments, the variant TACI polypeptide contains two or more amino acid substitutions of any two or more of the foregoing. In some embodiments, the variant TACI polypeptide includes one or more of amino acid substitution that is a conservative amino acid substitution of any of the foregoing. In provided embodiments, the variant TACI polypeptide includes the amino acid substitution in any reference TACI polypeptide sequence as described. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 1. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 13. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 130. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 131.

[0217] In some embodiments, the amino acid substitutions are D85E/K98T. In some embodiments, the amino acid substitutions are I87L/K98T. In some embodiments, the amino acid substitutions are R60G/Q75E/L82P. In some embodiments, the amino acid substitutions are R60G/C86Y. In some embodiments, the amino acid substitutions are W40R/L82P/F103Y. In some embodiments, the amino acid substitutions are W40R/Q59R/T61P/K98T. In some embodiments, the amino acid substitutions are L82P/I87L. In some embodiments, the amino acid substitutions are G76S/P97S. In some embodiments, the amino acid substitutions are K77E/R84L/F103Y. In some embodiments, the amino acid substitutions are Y79F/Q99E. In some embodiments, the amino acid substitutions are L83S/F103S. In some embodiments, the amino acid substitutions are K77E/R84Q. In some embodiments, the amino acid substitutions are K77E/A101D. In some embodiments, the amino acid substitutions are K77E/F78Y/Y102D. In some embodiments, the amino acid substitutions are Q75E/R84Q. In some embodiments, the amino acid substitutions are Q75R/R84G/I92V. In some embodiments, the amino acid substitutions are K77E/A101D/Y102D. In some embodiments, the amino acid substitutions are R84Q/S88N/A101D. In some embodiments, the amino acid substitutions are R84Q/F103V. In some embodiments, the amino acid substitutions are K77E/Q95R/A101D. In some embodiments, the amino acid substitutions are I87M/A101D. In provided embodiments, the variant TACI polypeptide includes the amino acid substitutions in any reference TACI polypeptide sequence as described. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 1. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 13. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 130. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 131.

[0218] In embodiments of any embodiments, the variant TACI polypeptide includes one or more amino acid substitutions from Q75E, K77E, F78Y, R84G, R84Q, A101D or Y102D, or any combination thereof. In some embodiments, the variant TACI polypeptide includes any 1, 2, 3, 4, 5 or 6 of the above amino acid substitutions. In some embodiments, the variant TACI polypeptide contains one of the above amino acid substitutions. In some embodiments, the variant TACI polypeptide contains two of the above amino acid substitutions. In some embodiments, the variant TACI polypeptide contains three of the above amino acid substitutions. In some embodiments, the variant TACI polypeptide contains four of the above amino acid substitutions. In some embodiments, the variant TACI polypeptide contains five of

the above amino acid substitutions. In some embodiments, the variant TACI polypeptide contains six of the above amino acid substitutions.

[0219] In embodiments of any embodiments, the one or more amino acid substitutions comprise Q75E/R84Q. In embodiments of any embodiments, the one or more amino acid substitutions comprise Q75E/K77E. In embodiments of any embodiments, the one or more amino acid substitutions comprise Q75E/F78Y. In embodiments of any embodiments, the one or more amino acid substitutions comprise Q75E/A101D. In embodiments of any embodiments, the one or more amino acid substitutions comprise Q75E/Y102D. In embodiments of any embodiments, the one or more amino acid substitutions comprise F77E/F78Y. In embodiments of any embodiments, the one or more amino acid substitutions comprise K77E/R84Q. In embodiments of any embodiments, the one or more amino acid substitutions comprise K77E/A101D. In embodiments of any embodiments, the one or more amino acid substitutions comprise K77E/Y102D. In embodiments of any embodiments, the one or more amino acid substitutions comprise F78Y/R84Q. In embodiments of any embodiments, the one or more amino acid substitutions comprise F78Y/A101D. In embodiments of any embodiments, the one or more amino acid substitutions comprise F78Y/Y102D. In embodiments of any embodiments, the one or more amino acid substitutions comprise R84Q/A101D. In embodiments of any embodiments, the one or more amino acid substitutions comprise R84Q/Y102D. In embodiments of any embodiments, the one or more amino acid substitutions comprise A101D/Y102D. In provided embodiments, the variant TACI polypeptide includes the amino acid substitutions in any reference TACI polypeptide sequence as described, such as in the sequence set forth in SEQ ID NO:1, SEQ ID NO:13, SEQ ID NO:130 or SEQ ID NO: 131.

[0220] In some embodiments, the variant TACI polypeptides includes the amino acid substitution(s) R84G, A101D, K77E/R84Q, K77E/A101D, K77E/F78Y, K77E/F78Y/Y102D, Q75E/R84Q, K77E/A101D/Y102D, R84Q, K77E, A101D, Q75E, K77E/F78Y/R84Q, F78Y, F78Y/R84Q, F78Y/A101D, F78Y/Y102D, or K77E/Y102D. In provided embodiments, the variant TACI polypeptide includes the amino acid substitutions in any reference TACI polypeptide sequence as described, such as in the sequence set forth in SEQ ID NO:1, SEQ ID NO:13, SEQ ID NO:130 or SEQ ID NO: 131.

[0221] In some embodiments, the variant TACI polypeptide includes the amino acid substitutions K77E and F78Y (K77E/F78Y). In provided embodiments, the variant TACI polypeptide includes the amino acid substitutions in any reference TACI polypeptide sequence as described. In some embodiments, the amino acid substitution is in the reference TACI

sequence set forth in SEQ ID NO: 1. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 13. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 130. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 131.

[0222] In some embodiments, the variant TACI polypeptide includes the amino acid substitutions K77E and Y102D (K77E/Y102D). In provided embodiments, the variant TACI polypeptide includes the amino acid substitutions in any reference TACI polypeptide sequence as described. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 1. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 13. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 130. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 131.

[0223] In some embodiments, the variant TACI polypeptide contains the amino acid substitutions F78Y and Y102D (F78Y/Y102D). In provided embodiments, the variant TACI polypeptide includes the amino acid substitutions in any reference TACI polypeptide sequence as described. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 1. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 13. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 130. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 131.

[0224] In some embodiments the variant TACI polypeptide contains the amino acid substitutions K77E, F78Y and Y102D (K77E/F78Y/Y102D). In provided embodiments, the variant TACI polypeptide includes the amino acid substitutions in any reference TACI polypeptide sequence as described. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 1. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 13. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 130. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 131.

[0225] In some embodiments, the variant TACI polypeptide contains the amino acid substitutions Q75E/R84Q. In provided embodiments, the variant TACI polypeptide includes the amino acid substitutions in any reference TACI polypeptide sequence as described. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 1. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 13. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 130. In some embodiments, the amino acid substitution is in the reference TACI sequence set forth in SEQ ID NO: 131.

[0226] In some embodiments, the variant TACI polypeptide comprises any of the mutations listed in Table 1. Table 1 also provides exemplary sequences by reference to SEQ ID NO of the reference (e.g., unmodified) TACI polypeptide, and exemplary variant TACI polypeptides. As indicated, the exact locus or residues corresponding to a given domain can vary, such as depending on the methods used to identify or classify the domain. Also, in some cases, adjacent N- and/or C-terminal amino acids of a given domain (e.g. CRD) also can be included in a sequence of a variant TACI polypeptide, such as to ensure proper folding of the domain when expressed. Thus, it is understood that the exemplification of the SEQ ID NOs in Table 1 is not to be construed as limiting. For example, the particular domain, such as the ECD domain or a portion thereof containing the CRD1/CRD2 or CRD2 only, of a variant TACI polypeptide can be several amino acids longer or shorter, such as 1-10, e.g., 1, 2, 3, 4, 5, 6 or 7 amino acids longer or shorter, than the sequence of amino acids set forth in the respective SEQ ID NO.

[0227] In some embodiments, the variant TACI polypeptide comprises any of the mutations (amino acid substitutions) listed in Table 1. In some examples, the mutations (amino acid substitutions) are made in a reference TACI containing the sequence of amino acids set forth in SEQ ID NO: 122. In some examples, the mutations (amino acid substitutions) are made a reference TACI that contains the CRD1 and CRD2 domain of TACI, for example as set forth in SEQ ID NO: 1. In some examples, the mutations (amino acid substitutions) are made in a reference TACI that is further truncated by deletion of N-terminal and C-terminal amino acid residues to retain the CRD2, for example as set forth in SEQ ID NO: 13.

[0228] The use of the term “modification”, such as “substitution” or “mutation,” does not imply that the present embodiments are limited to a particular method of making the immunomodulatory proteins. A variant TACI polypeptide can be made, for example, by *de novo* peptide synthesis and thus does not necessarily require a modification, such as a “substitution” in the sense of altering a codon to encode for the modification, e.g. substitution.

This principle also extends to the terms “addition” and “deletion” of an amino acid residue which likewise do not imply a particular method of making. The means by which the vTDs are designed or created is not limited to any particular method. In some embodiments, however, a wild-type or unmodified TD encoding nucleic acid is mutagenized from wild-type or unmodified TD genetic material and screened for desired specific binding activity, e.g. binding affinity, and/or alteration of NF- κ B modulation or other functional activity. In some embodiments, a vTD is synthesized *de novo* utilizing protein or nucleic acid sequences available at any number of publicly available databases and then subsequently screened. The National Center for Biotechnology Information provides such information and its website is publicly accessible via the internet as is the UniProtKB database.

[0229] In some embodiments, the variant TACI polypeptide comprises an extracellular domain (ECD) sequences containing a CRD1 and CRD2, such as a variant TACI polypeptide set forth in any one of SEQ ID NOS: 2-12, 21, 22, 101-120. In some embodiments, the variant TACI polypeptide comprises a polypeptide sequence that exhibits at least about 90% identity, at least about 91% identity, at least about 92% identity, at least about 93% identity, at least about 94% identity, at least about 95% identity, such as at least about 96% identity, 97% identity, 98% identity, or 99% identity to any one of SEQ ID NOS: 2-12, 21, 22, 101-120, and retains the amino acid modification(s), e.g. substitution(s) therein not present in the reference (e.g., unmodified or wild-type) TACI. In some embodiments, the variant TACI polypeptide comprises a specific binding fragment of any one of SEQ ID NOS: 2-12, 21, 22, 101-120, in which the specific binding fragment binds BAFF, APRIL or a BAFF/APRIL heterotrimer, and contains a contiguous sequence therein that contains the amino acid modification(s), e.g. substitution (s) therein not present in the reference (e.g., unmodified or wild-type) TACI.

[0230] In some embodiments, the variant TACI polypeptide consists or consists essentially of a variant TACI extracellular domain (ECD) sequences set forth in any one of SEQ ID NOS: 2-12, 21, 22, 101-120. In some embodiments, the variant TACI polypeptide consists or consists essentially of a polypeptide sequence that exhibits at least about 90% identity, at least about 91% identity, at least about 92% identity, at least about 93% identity, at least about 94% identity, at least about 95% identity, such as at least about 96% identity, 97% identity, 98% identity, or 99% identity to any one of SEQ ID NOS: 2-12, 21, 22, 101-120, and retains the amino acid modification(s), e.g. substitution(s) therein not present in the reference (e.g., unmodified or wild-type) TACI. In some embodiments, the variant TACI polypeptide consists or consists essentially of a specific binding fragment of any one of SEQ ID NOS: 2-12, 21, 22,

101-120, in which the specific binding fragment binds BAFF, APRIL or an APRIL/BAFF heterotrimer and contains a contiguous sequence therein that contains the amino acid modification(s), e.g. substitution (s) therein not present in the reference (e.g., unmodified or wild-type) TACI.

[0231] In some embodiments, the variant TACI polypeptide comprises an extracellular domain (ECD) sequences containing a CRD2 but lacking the CRD1 of a reference TACI polypeptide, such as a variant TACI polypeptide set forth in any one of SEQ ID NOS: 14-20, 23-35, 92-100, 177-192. In some embodiments, the variant TACI polypeptide comprises a polypeptide sequence that exhibits at least about 90% identity, at least about 91% identity, at least about 92% identity, at least about 93% identity, at least about 94% identity, at least about 95% identity, such as at least about 96% identity, 97% identity, 98% identity, or 99% identity to any one of SEQ ID NOS: 14-20, 23-35, 92-100, 177-192, and retains the amino acid modification(s), e.g. substitution(s) therein not present in the reference (e.g., unmodified or wild-type) TACI. In some embodiments, the variant TACI polypeptide comprises a specific binding fragment of any one of SEQ ID NOS: 14-20, 23-35, 92-100, 177-192 in which the specific binding fragment binds BAFF, APRIL or a BAFF/APRIL heterotrimer, and contains a contiguous sequence therein that contains the amino acid modification(s), e.g. substitution (s) therein not present in the reference (e.g., unmodified or wild-type) TACI.

[0232] In some embodiments, the variant TACI polypeptide consists or consists essentially of the sequence set forth in any one of SEQ ID NOS: 14-20, 23-35, 92-100, 177-192. In some embodiments, the variant TACI polypeptide consists or consists essentially of a polypeptide sequence that exhibits at least about 90% identity, at least about 91% identity, at least about 92% identity, at least about 93% identity, at least about 94% identity, at least about 95% identity, such as at least about 96% identity, 97% identity, 98% identity, or 99% identity to any one of SEQ ID NOS: 14-20, 23-35, 92-100, 177-192, and retains the amino acid modification(s), e.g. substitution(s) therein not present in the reference (e.g., unmodified or wild-type) TACI. In some embodiments, the variant TACI polypeptide consists or consists essentially of a specific binding fragment of any one of SEQ ID NOS: 14-20, 23-35, 92-100, 177-192, in which the specific binding fragment binds BAFF, APRIL or a BAFF/APRIL heterotrimer, and contains a contiguous sequence therein that contains the amino acid modification(s), e.g. substitution (s) therein not present in the reference (e.g., unmodified or wild-type) TACI.

[0233] In some embodiments, the variant TACI polypeptide comprises the sequence set forth in SEQ ID NO:20. In some embodiments, the variant TACI polypeptide consists

essentially of the sequence set forth in SEQ ID NO:20. In some embodiments, the variant TACI polypeptide consists of the sequence set forth in SEQ ID NO:20.

[0234] In some embodiments, the variant TACI polypeptide comprises the sequence set forth in SEQ ID NO:26. In some embodiments, the variant TACI polypeptide consists essentially of the sequence set forth in SEQ ID NO:26. In some embodiments, the variant TACI polypeptide consists of the sequence set forth in SEQ ID NO:26.

[0235] In some embodiments, the variant TACI polypeptide comprises the sequence set forth in SEQ ID NO:27. In some embodiments, the variant TACI polypeptide consists essentially of the sequence set forth in SEQ ID NO:27. In some embodiments, the variant TACI polypeptide consists of the sequence set forth in SEQ ID NO:27.

[0236] In some embodiments, the variant TACI polypeptide comprises the sequence set forth in SEQ ID NO:107. In some embodiments, the variant TACI polypeptide consists essentially of the sequence set forth in SEQ ID NO:107. In some embodiments, the variant TACI polypeptide consists of the sequence set forth in SEQ ID NO:107.

[0237] In some embodiments, the variant TACI polypeptide is encoded by a sequence of nucleotides set forth in any of SEQ ID NOS: 37-47, 56 or 57. In some embodiments, the variant TACI polypeptide is encoded by a sequence of nucleotides that exhibits at least about 90% identity, at least about 91% identity, at least about 92% identity, at least about 93% identity, at least about 94% identity, at least about 95% identity, such as at least about 96% identity, 97% identity, 98% identity, or 99% identity to any one of SEQ ID NOS: 37-47, 56 or 57, and retains the amino acid modification(s), e.g. substitution(s) therein not present in the reference (e.g., unmodified or wild-type) TACI. Also provided herein is a nucleic acid containing the sequence set forth in any of SEQ ID NOS: 37-47, 56 or 57 or a sequence that exhibits at least 90% identity, at least 91% identity, at least 92% identity, at least 93% identity, at least 94% identity, at least 95% identity, such as at least 96% identity, 97% identity, 98% identity, or 99% identity to any one of SEQ ID NOS: 37-47, 56 or 57.

[0238] In some embodiments, the variant TACI polypeptide is encoded by a sequence of nucleotides set forth in any of SEQ ID NOS: 49-55 or 58-70. In some embodiments, the variant TACI polypeptide is encoded by a sequence of nucleotides that exhibits at least about 90% identity, at least about 91% identity, at least about 92% identity, at least about 93% identity, at least about 94% identity, at least about 95% identity, such as at least about 96% identity, 97% identity, 98% identity, or 99% identity to any one of SEQ ID NOS: 49-55 or 58-70, and retains the amino acid modification(s), e.g. substitution(s) therein not present in the reference(e.g.,

unmodified or wild-type) TACI. Also provided herein is a nucleic acid containing the sequence set forth in any of SEQ ID NOS: 49-55 or 58-70 or a sequence that exhibits at least 90% identity, at least 91% identity, at least 92% identity, at least 93% identity, at least 94% identity, at least 95% identity, such as at least 96% identity, 97% identity, 98% identity, or 99% identity to any one of SEQ ID NOS: 549-55 or 58-70.

[0239] In some embodiments, also provided herein are TACI ECD fusion sequences in which any of the above TACI ECD sequence is linked or fused to a multimerization domain, such as any described herein.

[0240] Interaction of two or more polypeptides of the immunomodulatory proteins can be facilitated by their linkage, either directly or indirectly, to any moiety or other polypeptide that are themselves able to interact to form a stable structure. For example, separate encoded polypeptide chains can be joined by multimerization, whereby multimerization of the polypeptides is mediated by a multimerization domain. Typically, the multimerization domain provides for the formation of a stable protein-protein interaction between a first polypeptide and a second polypeptide.

[0241] In some embodiments, the two or more individual polypeptides of the immunomodulatory proteins can be joined by multimerization, such as joined as dimeric, trimeric, tetrameric, or pentameric molecules. In some cases, the individual polypeptides are the

same. For example, a trimeric molecule can be formed from three copies of the same individual polypeptide. In other examples, a tetrameric molecule is generated from four copies of the same individual polypeptides. In further examples, a pentameric molecule is generated from five copies of the same individual polypeptides. The multimerization domain may be one that facilitates dimerization, trimerization, tetramerization, or pentamerization of the polypeptide chains.

[0242] In some embodiments, the immunomodulatory protein forms a multimer, e.g., a dimer. In some embodiments, the dimer is a homodimer in which the two polypeptides of the immunomodulatory protein are the same. In some embodiments, the dimer is a heterodimer in which the two polypeptides of the immunomodulatory protein are different.

[0243] In some embodiments, a multimerization domain includes any capable of forming a stable protein-protein interaction. The multimerization domains can interact via an immunoglobulin sequence (e.g. Fc domain; see e.g., International Patent Pub. Nos. WO 93/10151 and WO 2005/063816 US; U.S. Pub. No. 2006/0024298; U.S. Pat. No. 5,457,035); leucine zipper (e.g. from nuclear transforming proteins fos and jun or the proto-oncogene c-myc or from General Control of Nitrogen (GCN4)) (see e.g., Busch and Sassone-Corsi (1990) Trends Genetics, 6:36-40; Gentz et al., (1989) Science, 243:1695-1699); a hydrophobic region; a hydrophilic region; or a free thiol which forms an intermolecular disulfide bond between the chimeric molecules of a homo- or heteromultimer. In addition, a multimerization domain can include an amino acid sequence comprising a protuberance complementary to an amino acid sequence comprising a hole, such as is described, for example, in U.S. Pat. No. 5,731,168; International Patent Pub. Nos. WO 98/50431 and WO 2005/063816; Ridgway et al. (1996) Protein Engineering, 9:617-621. Such a multimerization region can be engineered such that steric interactions not only promote stable interaction, but further promote the formation of heterodimers over homodimers from a mixture of chimeric monomers. Generally, protuberances are constructed by replacing small amino acid side chains from the interface of the first polypeptide with larger side chains (e.g., tyrosine or tryptophan). Compensatory cavities of identical or similar size to the protuberances are optionally created on the interface of the second polypeptide by replacing large amino acid side chains with smaller ones (e.g., alanine or threonine). Exemplary multimerization domains are described below.

[0244] The TACI polypeptide sequence (e.g. variant TACI polypeptide sequence) can be joined anywhere, but typically via its N- or C-terminus, to the N- or C-terminus of a multimerization domain to form a chimeric polypeptide. The linkage can be direct or indirect

via a linker. Also, the chimeric polypeptide can be a fusion protein or can be formed by chemical linkage, such as through covalent or non-covalent interactions. For example, when preparing a chimeric polypeptide containing a multimerization domain, nucleic acid encoding all or part of a TACI polypeptide sequence such as any described TACI ECD, including a variant TACI polypeptide sequence, can be operably linked to nucleic acid encoding the multimerization domain sequence, directly or indirectly or optionally via a linker domain. In some cases, the construct encodes a chimeric protein where the C-terminus of the TACI polypeptide sequence is joined to the N-terminus of the multimerization domain. In some instances, a construct can encode a chimeric protein where the N-terminus of the TACI polypeptide sequence is joined to the N- or C-terminus of the multimerization domain.

[0245] A polypeptide multimer contains two chimeric proteins created by linking, directly or indirectly, two of the same or different TACI polypeptide sequences (e.g. two of the same or different variant TACI polypeptide sequences) directly or indirectly to a multimerization domain. In some examples, where the multimerization domain is a polypeptide, a gene fusion encoding the TACI polypeptide sequence (e.g. variant TACI polypeptide sequence) and multimerization domain is inserted into an appropriate expression vector. The resulting chimeric or fusion protein can be expressed in host cells transformed with the recombinant expression vector, and allowed to assemble into multimers, where the multimerization domains interact to form multivalent polypeptides. Chemical linkage of multimerization domains to the TACI polypeptide (e.g. variant TACI polypeptide) can be effected using heterobifunctional linkers.

[0246] The resulting chimeric polypeptides, such as fusion proteins, and multimers formed therefrom, can be purified by any suitable method such as, for example, by affinity chromatography over Protein A or Protein G columns. Where two nucleic acid molecules encoding different polypeptides are transformed into cells, formation of homo- and heterodimers will occur. Conditions for expression can be adjusted so that heterodimer formation is favored over homodimer formation.

[0247] In some embodiments, the multimerization domain is an Fc region of an immunoglobulin.

[0248] In some embodiments, the multimerization domain is an immunoglobulin (e.g. IgG1) Fc region, in which the fusion protein is a TACI-Fc containing (1) a TACI sequence containing or consisting of any of the provided TACI ECD sequences; and (2) an immunoglobulin Fc region. Thus, among provided embodiments are TACI-Fc fusion proteins containing (1) a TACI

sequence containing or consisting of any of the above described TACI ECD polypeptide sequences, such as variant TACI polypeptide; and (2) an immunoglobulin Fc region.

[0249] In some embodiments, provided herein is a TACI-Fc fusion sequence that contains (1) a TACI ECD sequence that comprises the sequence set forth in SEQ ID NO:13, and (2) an immunoglobulin Fc region. In some embodiments, provided herein is a TACI-Fc fusion sequence that contains (1) a TACI ECD sequence that consists or consists essentially of the sequence set forth in SEQ ID NO:13, and (2) an immunoglobulin Fc region.

[0250] In some embodiments, the TACI-Fc fusion is a variant TACI-Fc fusion containing or consisting of any of the above described variant TACI polypeptides and an immunoglobulin Fc region.

[0251] In some embodiments, provided herein is a variant TACI-Fc fusion sequence that contains (1) a TACI ECD sequence containing a CRD1 and a CRD2, for example a TACI sequence that contains the sequence set forth in any one of SEQ ID NOS: 2-12, 21, 22, 101-120, and (2) an immunoglobulin Fc region. In some embodiments, provided herein is a variant TACI-Fc fusion sequence that contains (1) a TACI ECD sequence containing a CRD1 and a CRD2, for example a TACI sequence that consist or consists essentially of the sequence set forth in any one of SEQ ID NOS: 2-12, 21, 22, 101-120, and (2) an immunoglobulin Fc region.

[0252] In some embodiments, provided herein is a variant TACI-Fc fusion sequence that contains (1) a TACI ECD sequence containing the CRD2 but lacking the CRD1 domain, for example a TACI sequence that contains the sequence set forth in any one of SEQ ID NOS: 14-20, 23-35, 92-100, 177-192 and (2) an immunoglobulin Fc region. In some embodiments, provided herein is a variant TACI-Fc fusion sequence that contains (1) a TACI ECD sequence containing the CRD2 domain but lacking the CRD1 domain, for example a TACI sequence that consists or consists essentially of the sequence set forth in any one of SEQ ID NOS: 14-20, 23-35, 92-100, 177-192 and (2) an immunoglobulin Fc region.

[0253] In provided embodiments of a TACI-Fc, the immunoglobulin Fc region can be a wild-type Fc of an immunoglobulin, such as an IgG1 Fc. In some cases, the Fc region can be a variant Fc that lacks effector function (also called “effectorless Fc”). Exemplary Fc regions and variants thereof in provided TACI-Fc fusion proteins are described below.

[0254] In some embodiments, the Fc is murine or human Fc. In some embodiments, the Fc is a mammalian or human IgG1, IgG2, IgG3, or IgG4 Fc regions.

[0255] In some embodiments, the Fc region is or comprises the sequence set forth in any one of SEQ ID NOS: 71, 73, 75, 81, 82, 83, 134, 135, 136, 137, 138, 139, 140, 173, 174, 175,

176, 193, 218, 219, 220, or 221. In some embodiments, the Fc region is or is derived from an IgG1, such as set forth in any one of SEQ ID NOS: 71, 73, 75, 81, 82, 83, 134, 135, 136, 137, 139, 140, 173, 174, 175, 176, 193, 218, 220, or 221. In some embodiments, the Fc region is or is derived from an IgG2, such as any set forth in SEQ ID NO: 138 or 219. In some embodiments, the Fc region is or is derived from an IgG4, such as any set forth in SEQ ID NO: 139, 140 or 220. In some embodiments, an Fc region in Fc fusion proteins provided herein also can include an Fc region that exhibits at least about 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% to any of the above Fc regions.

[0256] In some embodiments, the Fc is derived from IgG1, such as human IgG1. In some embodiments, the Fc is an IgG1 Fc set forth in SEQ ID NO: 71 having an allotype containing residues Glu (E) and Met (M) at positions 356 and 358 by EU numbering. In some embodiments, the Fc comprises the amino acid sequence set forth in SEQ ID NO: 71 or a sequence of amino acids that exhibits at least about 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to SEQ ID NO: 71. In other embodiments, the Fc is an IgG1 Fc that contains amino acids of the human G1m1 allotype, such as residues containing Asp (D) and Leu (L) at positions 356 and 358, e.g. as set forth in SEQ ID NO:81. Thus, in some cases, an Fc provided herein can contain amino acid substitutions E356D and M358L to reconstitute residues of allotype G1 m1. In some embodiments, the Fc comprises the amino acid sequence set forth in SEQ ID NO: 81 or a sequence of amino acids that exhibits at least about 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to SEQ ID NO: 81.

[0257] In some embodiments, the Fc region has the amino acid sequence set forth in SEQ ID NO:81.

LSPG (SEQ ID NO:81)

[0258] In some embodiments, the variant Fc comprises the sequence set forth in SEQ ID NO: 173. In some embodiments, the variant Fc comprises the sequence set forth in SEQ ID NO:174. In some embodiments, an Fc region used in a construct provided herein can further lack a C-terminal lysine residue.

[0259] In some embodiments, the Fc is derived from IgG2, such as human IgG2. In some embodiments, the Fc comprises the amino acid sequence set forth in SEQ ID NO: 138 or a sequence of amino acids that exhibits at least about 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to SEQ ID NO: 138. In some embodiments, the Fc region is an IgG2 Fc region that has the sequence set forth in SEQ ID NO: 138. In some embodiments, the Fc region is an IgG2 Fc region that has the sequence set forth in SEQ ID NO: 219.

[0260] In some embodiments, the Fc is derived from IgG4, such as human IgG4. In some embodiments, the Fc comprises the amino acid sequence set forth in SEQ ID NO: 139 or a sequence of amino acids that exhibits at least about 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to SEQ ID NO: 139. In some embodiments, the IgG4 Fc is a stabilized Fc in which the CH3 domain of human IgG4 is substituted with the CH3 domain of human IgG1 and which exhibits inhibited aggregate formation, an antibody in which the CH3 and CH2 domains of human IgG4 are substituted with the CH3 and CH2 domains of human IgG1, respectively, or an antibody in which arginine at position 409 indicated in the EU index proposed by Kabat et al. of human IgG4 is substituted with lysine and which exhibits inhibited aggregate formation (see e.g. U.S. Patent No. 8,911,726. In some embodiments, the Fc is an IgG4 containing the S228P mutation, which has been shown to prevent recombination between a therapeutic antibody and an endogenous IgG4 by Fab-arm exchange (see e.g. Labrijn et al. (2009) Nat. Biotechnol., 27(8): 767-71.) In some embodiments, the Fc comprises the amino acid sequence set forth in SEQ ID NO: 140 or a sequence of amino acids that exhibits at least about 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to SEQ ID NO: 140. In some embodiments, the Fc region is an IgG4 Fc region set forth in SEQ ID NO:140. In some embodiments, the Fc region is an IgG4 Fc region set forth in SEQ ID NO:220.

[0261] In some embodiments, the Fc region is a variant Fc region in which a wild-type Fc is modified by one or more amino acid substitutions to reduce effector activity or to render the Fc inert for Fc effector function. Exemplary effectorless or inert mutations include those described herein.

[0262] In some embodiments, the Fc region contains one more modifications that alter (e.g. reduce) one or more of its normal functions. In general, the Fc region is responsible for effector functions, such as complement-dependent cytotoxicity (CDC) and antibody-dependent cell cytotoxicity (ADCC), in addition to the antigen-binding capacity, which is the main function of

immunoglobulins. Additionally, the FcRn sequence present in the Fc region plays the role of regulating the IgG level in serum by increasing the *in vivo* half-life by conjugation to an *in vivo* FcRn receptor. In some embodiments, such functions can be reduced or altered in an Fc for use with the provided Fc fusion proteins.

[0263] In some embodiments, one or more amino acid modifications may be introduced into the Fc region, thereby generating an Fc region variant. In some embodiments, the Fc region variant has decreased effector function. There are many examples of changes or mutations to Fc sequences that can alter effector function. For example, WO 00/42072, WO2006019447, WO2012125850, WO2015/107026, US2016/0017041 and Shields *et al. J Biol. Chem.* 9(2): 6591-6604 (2001) describe exemplary Fc variants with improved or diminished binding to FcRs. The contents of those publications are specifically incorporated herein by reference.

[0264] In some embodiments, the provided immunomodulatory proteins comprise an Fc region that exhibits reduced effector functions, which makes it a desirable candidate for applications in which the half-life of the immunomodulatory protein *in vivo* is important yet certain effector functions (such as CDC and ADCC) are unnecessary or deleterious. *In vitro* and/or *in vivo* cytotoxicity assays can be conducted to confirm the reduction/depletion of CDC and/or ADCC activities. For example, Fc receptor (FcR) binding assays can be conducted to ensure that the immunomodulatory protein lacks FcγR binding (hence likely lacking ADCC activity), but retains FcRn binding ability. The primary cells for mediating ADCC, NK cells, express FcγRIII only, whereas monocytes express FcγRI, FcγRII and FcγRIII. FcR expression on hematopoietic cells is summarized in Table 2 on page 464 of Ravetch and Kinet, *Annu. Rev. Immunol.* 9:457-492 (1991). Non-limiting examples of *in vitro* assays to assess ADCC activity of a molecule of interest is described in U.S. Pat. No. 5,500,362 (see, *e.g.* Hellstrom, I. *et al. Proc. Nat'l Acad. Sci. USA* 83:7059-7063 (1986)) and Hellstrom, I *et al.*, *Proc. Nat'l Acad. Sci. USA* 82:1499-1502 (1985); U.S. Pat. No. 5,821,337 (see Bruggemann, M. *et al.*, *J. Exp. Med.* 166:1351-1361 (1987)). Alternatively, non-radioactive assay methods may be employed (see, for example, ACTI™ non-radioactive cytotoxicity assay for flow cytometry (CellTechnology, Inc. Mountain View, Calif.; and CytoTox 96™ non-radioactive cytotoxicity assay (Promega, Madison, Wis.). Useful effector cells for such assays include peripheral blood mononuclear cells (PBMC) and Natural Killer (NK) cells. Alternatively, or additionally, ADCC activity of the molecule of interest may be assessed *in vivo*, *e.g.*, in an animal model such as that disclosed in Clynes *et al. Proc. Nat'l Acad. Sci. USA* 95:652-656 (1998). C1q binding assays may also be carried out to confirm that the immunomodulatory protein is unable to bind C1q and hence lacks

CDC activity. See, e.g., C1q and C3c binding ELISA in WO 2006/029879 and WO 2005/100402. To assess complement activation, a CDC assay may be performed (see, for example, Gazzano-Santoro *et al.*, *J. Immunol. Methods* 202:163 (1996); Cragg, M. S. *et al.*, *Blood* 101:1045-1052 (2003); and Cragg, M. S. and M. J. Glennie, *Blood* 103:2738-2743 (2004)). FcRn binding and *in vivo* clearance/half life determinations can also be performed using methods known in the art (see, e.g., Petkova, S. B. *et al.*, *Int'l. Immunol.* 18(12):1759-1769 (2006)).

[0265] Immunomodulatory proteins with reduced effector function include those with substitution of one or more of Fc region residues 238, 265, 269, 270, 297, 327 and 329 by EU numbering (U.S. Pat. No. 6,737,056). Such Fc mutants include Fc mutants with substitutions at two or more of amino acid positions 265, 269, 270, 297 and 327 by EU numbering, including the so-called “DANA” Fc mutant with substitution of residues 265 and 297 to alanine (U.S. Pat. No. 7,332,581).

[0266] In some embodiments, the Fc region of immunomodulatory proteins has an Fc region in which any one or more of amino acids at positions 234, 235, 236, 237, 238, 239, 270, 297, 298, 325, and 329 (indicated by EU numbering) are substituted with different amino acids compared to the native Fc region. Such alterations of Fc region include, for example, alterations such as deglycosylated chains (N297A and N297Q), IgG1-N297G, IgG1-L234A/L235A, IgG1-L234A/L235E/G237A, IgG1-A325A/A330S/P331S, IgG1-C226S/C229S, IgG1-C226S/C229S/E233P/L234V/L235A, IgG1-E233P/L234V/L235A/G236del/ S267K, IgG1-L234F/L235E/P331S, IgG1-S267E/L328F, IgG2-V234A/G237A, IgG2-H268Q/V309L/A330S/A331S, IgG4-L235A/G237A/E318A, and IgG4-L236E described in Current Opinion in Biotechnology (2009) 20 (6), 685-691; alterations such as G236R/L328R, L235G/G236R, N325A/L328R, and N325LL328R described in WO 2008/092117; amino acid insertions at positions 233, 234, 235, and 237 (indicated by EU numbering); and alterations at the sites described in WO 2000/042072.

[0267] Certain Fc variants with improved or diminished binding to FcRs are described. (See, e.g., U.S. Pat. No. 6,737,056; WO 2004/056312, WO2006019447 and Shields *et al.*, *J. Biol. Chem.* 9(2): 6591-6604 (2001).)

[0268] In some embodiments, there is provided an immunomodulatory protein comprising a variant Fc region comprising one or more amino acid substitutions which increase half-life and/or improve binding to the neonatal Fc receptor (FcRn). Antibodies with increased half-lives and improved binding to FcRn are described in US2005/0014934A1 (Hinton *et al.*) or

WO2015107026. Those antibodies comprise an Fc region with one or more substitutions therein which improve binding of the Fc region to FcRn. Such Fc variants include those with substitutions at one or more of Fc region residues: 238, 256, 265, 272, 286, 303, 305, 307, 311, 312, 317, 340, 356, 360, 362, 376, 378, 380, 382, 413, 424 or 434 by EU numbering, *e.g.*, substitution of Fc region residue 434 (U.S. Pat. No. 7,371,826).

[0269] In some embodiments, the Fc region of the immunomodulatory protein comprises one or more amino acid substitutions C220S, C226S and/or C229S by EU numbering. In some embodiments, the Fc region of the immunomodulatory protein comprises one or more amino acid substitutions R292C and V302C. *See also* Duncan & Winter, *Nature* 322:738-40 (1988); U.S. Pat. No. 5,648,260; U.S. Pat. No. 5,624,821; and WO 94/29351 concerning other examples of Fc region variants.

[0270] In some embodiments, alterations are made in the Fc region that result in diminished C1q binding and/or Complement Dependent Cytotoxicity (CDC), *e.g.*, as described in U.S. Pat. No. 6,194,551, WO 99/51642, and Idusogie *et al.*, *J. Immunol.* 164: 4178-4184 (2000).

[0271] In some embodiments, the variant Fc region comprising the one or more amino acid modifications (*e.g.* amino acid substitutions) is derived from a wild-type IgG1, such as a wild-type human IgG1. In some embodiments, the wild-type IgG1 Fc can be the Fc set forth in SEQ ID NO: 71 having an allotype containing residues Glu (E) and Met (M) at positions 356 and 358 by EU numbering. In some embodiments, the variant Fc region is derived from the amino acid sequence set forth in SEQ ID NO: 71. In other embodiments, the wild-type IgG1 Fc contains amino acids of the human G1m1 allotype, such as residues containing Asp (D) and Leu (L) at positions 356 and 358, *e.g.* as set forth in SEQ ID NO:81. Thus, in some cases, the variant Fc is derived from the amino acid sequence set forth in SEQ ID NO:81.

[0272] In some embodiments, the Fc region lacks the C-terminal lysine corresponding to position 232 of the wild-type or unmodified Fc set forth in SEQ ID NO: 71 or 81 (corresponding to K447del by EU numbering).

[0273] In some embodiments, the variant Fc region comprises a C5S amino acid modification of the wild-type or unmodified Fc region by numbering of SEQ ID NO: 71 (corresponding to C220S by EU numbering).

[0274] In some embodiments, the Fc region is a variant Fc that contains at least one amino acid substitution that is N82G by numbering of SEQ ID NO: 71 (corresponding to N297G by EU numbering). In some embodiments, the Fc further contains at least one amino acid substitution that is R77C or V87C by numbering of SEQ ID NO: 71 (corresponding to R292C or

V302C by EU numbering). In some embodiments, the variant Fc region further comprises a C5S amino acid modification by numbering of SEQ ID NO: 71 (corresponding to C220S by EU numbering). For example, in some embodiments, the variant Fc region comprises the following amino acid modifications: N297G and one or more of the following amino acid modifications C220S, R292C or V302C by EU numbering (corresponding to N82G and one or more of the following amino acid modifications C5S, R77C or V87C with reference to SEQ ID NO:71), e.g., the Fc region comprises the sequence set forth in SEQ ID NO:82.

[0275] In some embodiments, the variant Fc contains the amino acid substitutions L234A/L235E/G237A, by EU numbering. In some embodiments, the variant Fc contains the amino acid substitutions A330S/P331S, by EU numbering. In some embodiments, the variant Fc contains the amino acid substitutions L234A/L235E/G237A/A330S/P331S (Gross et al. (2001) Immunity 15:289). In some embodiments, the variant Fc comprises the sequence set forth in SEQ ID NO: 175. In some embodiments, the variant Fc comprises the sequence set forth in SEQ ID NO:176. In some embodiments, an Fc region used in a construct provided herein can further lack a C-terminal lysine residue.

[0276] In some embodiments, the Fc region is a variant Fc that includes mutations L234A, L235E and G237A by EU numbering. In some embodiments, a wild-type Fc is further modified by the removal of one or more cysteine residue, such as by replacement of the cysteine residues to a serine residue at position 220 (C220S) by EU numbering. Exemplary inert Fc regions having reduced effector function are set forth in SEQ ID NO: 83 and SEQ ID NO:75, which are based on allotypes set forth in SEQ ID NO:71 or SEQ ID NO: 81, respectively. In some embodiments, an Fc region can further lack a C-terminal lysine residue. In some embodiments, the variant Fc region comprises one or more of the amino acid modifications C220S, L234A, L235E or G237A, e.g. the Fc region comprises the sequence set forth in SEQ ID NO:73, 75, 83 or 136. In some embodiments, the variant Fc comprises has the sequence set forth in SEQ ID NO: 73. In some embodiments, the variant Fc comprises has the sequence set forth in SEQ ID NO: 75. In some embodiments, the variant Fc comprises has the sequence set forth in SEQ ID NO: 83. In some embodiments, the variant Fc comprises has the sequence set forth in SEQ ID NO: 136.

[0277] In some embodiments, the Fc region is a variant Fc that has the sequence set forth in SEQ ID NO:73.

[0280] In some embodiments, the Fc region is a variant Fc region that comprises one or more of the amino acid modifications C220S, L235P, L234V, L235A, G236del or S267K, e.g. the Fc region comprises the sequence set forth in SEQ ID NO:134. In some embodiments, the Fc region lacks the C-terminal lysine corresponding to position 232 of the wild-type or unmodified Fc set forth in SEQ ID NO: 71 (corresponding to K447del by EU numbering).

[0281] In some embodiments, the Fc region is a variant Fc region that comprises one or more of the amino acid modifications C220S, R292C, N297G, V302C. In some embodiments, the Fc region lacks the C-terminal lysine corresponding to position 232 of the wild-type or unmodified Fc set forth in SEQ ID NO: 71 (corresponding to K447del by EU numbering). An exemplary variant Fc region is set forth in SEQ ID NO: 135.

[0282] In some embodiments, the variant Fc region comprises one or more of the amino acid modifications C220S/E233P/L234V/L235A/G236del/S267K. In some embodiments, the Fc region lacks the C-terminal lysine corresponding to position 232 of the wild-type or unmodified Fc set forth in SEQ ID NO: 71 (corresponding to K447del by EU numbering). An exemplary variant Fc region is set forth in SEQ ID NO: 137.

[0283] Examples of such Fc regions for inclusion in an immunomodulatory polypeptide are set forth in Table 2.

Table 2: Exemplary IgG1 Fc Regions, wild-type or variant (effectorless)

[0284] In some embodiments, the Fc region is a variant Fc region containing any combination of the Fc mutations in Table 2. In some embodiments, the Fc region is a variant Fc region having the sequence set forth in any one of the SEQ ID NOS in Table 2.

[0285] For example, a variant Fc region may be an effectorless Fc that exhibits reduced effector activity compared to a wild-type IgG1 set forth in SEQ ID NO:71 or SEQ ID NO:81. In some embodiments, the variant Fc comprises the sequence of amino acids set forth in any of SEQ ID NOS:75, 82, 83, 134, 73, 135, 136, or 137 or a sequence of amino acids that exhibits at least about 85%, 86%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to any of SEQ ID NOS: 75, 82, 83, 134, 73, 135, 136, or 137. In some embodiments, the variant Fc has the sequence set forth in SEQ ID NO: 73. In embodiments, when produced and expressed from cells, the provided immunomodulatory protein (e.g. TACI-Fc fusion) is a homodimer containing two identical polypeptide chains.

[0286] In some embodiments, the immunomodulatory protein contains a first immunomodulatory Fc fusion polypeptide and a second immunomodulatory Fc fusion polypeptide in which the first and second polypeptide are different. In some embodiments, a

first Fc polypeptide fusion contains an Fc region and one or more variant TACI polypeptide sequence and a second polypeptide fusion contains an Fc region and one or more TACI polypeptide sequence. In such embodiments, the Fc region can be a region that promotes or facilitates formation of heterodimers.

[0287] In some embodiments, the Fc domain of one or both of the first and second immunomodulatory Fc fusion polypeptides comprise a modification (e.g. substitution) such that the interface of the Fc molecule is modified to facilitate and/or promote heterodimerization. Methods to promote heterodimerization of Fc chains include mutagenesis of the Fc region, such as by including a set of “knob-into-hole” mutations or including mutations to effect electrostatic steering of the Fc to favor attractive interactions among different polypeptide chains. In some embodiments, the Fc region of the heterodimeric molecule additionally can contain one or more other Fc mutation, such as any described above. In some embodiments, the heterodimer molecule contains an Fc region with a mutation that reduces effector function. In some embodiments, such Fc regions contain mutations C220S, L234A, L235E and/or G237A by EU numbering. In some embodiments, any of the above mutations in an Fc backbone can be made in an allotype containing residues Glu (E) and Met (M) at positions 356 and 358 by EU numbering. In other embodiments, any of the above mutations in an Fc backbone can be made in an allotype containing residue Asp (D) and Leu (L) at positions 356 and 358 by EU numbering.

[0288] In some embodiments, modifications include introduction of a protuberance (knob) into a first Fc polypeptide and a cavity (hole) into a second Fc polypeptide such that the protuberance is positionable in the cavity to promote complexing of the first and second Fc-containing polypeptides. Amino acids targeted for replacement and/or modification to create protuberances or cavities in a polypeptide are typically interface amino acids that interact or contact with one or more amino acids in the interface of a second polypeptide.

[0289] In some embodiments, a first polypeptide that is modified to contain protuberance (knob) amino acids include replacement of a native or original amino acid with an amino acid that has at least one side chain which projects from the interface of the first polypeptide and is therefore positionable in a compensatory cavity (hole) in an adjacent interface of a second polypeptide. Most often, the replacement amino acid is one which has a larger side chain volume than the original amino acid residue. One of skill in the art knows how to determine and/or assess the properties of amino acid residues to identify those that are ideal replacement amino acids to create a protuberance. In some embodiments, the replacement residues for the formation

of a protuberance are naturally occurring amino acid residues and include, for example, arginine (R), phenylalanine (F), tyrosine (Y), or tryptophan (W). In some examples, the original residue identified for replacement is an amino acid residue that has a small side chain such as, for example, alanine, asparagine, aspartic acid, glycine, serine, threonine, or valine.

[0290] In some embodiments, a second polypeptide that is modified to contain a cavity (hole) is one that includes replacement of a native or original amino acid with an amino acid that has at least one side chain that is recessed from the interface of the second polypeptide and thus is able to accommodate a corresponding protuberance from the interface of a first polypeptide. Most often, the replacement amino acid is one which has a smaller side chain volume than the original amino acid residue. One of skill in the art knows how to determine and/or assess the properties of amino acid residues to identify those that are ideal replacement residues for the formation of a cavity. Generally, the replacement residues for the formation of a cavity are naturally occurring amino acids and include, for example, alanine (A), serine (S), threonine (T) and valine (V). In some examples, the original amino acid identified for replacement is an amino acid that has a large side chain such as, for example, tyrosine, arginine, phenylalanine, or tryptophan.

[0291] The CH3 interface of human IgG1, for example, involves sixteen residues on each domain located on four anti-parallel β -strands which buries 1090 Å² from each surface (see e.g., Deisenhofer et al. (1981) *Biochemistry*, 20:2361-2370; Miller et al., (1990) *J Mol. Biol.*, 216, 965-973; Ridgway et al., (1996) *Prot. Engin.*, 9: 617-621; U.S. Pat. No. 5,731,168). Modifications of a CH3 domain to create protuberances or cavities are described, for example, in U.S. Pat. No. 5,731,168; International Patent Applications WO98/50431 and WO 2005/063816; and Ridgway et al., (1996) *Prot. Engin.*, 9: 617-621. In some examples, modifications of a CH3 domain to create protuberances or cavities are typically targeted to residues located on the two central anti-parallel β -strands. The aim is to minimize the risk that the protuberances which are created can be accommodated by protruding into the surrounding solvent rather than being accommodated by a compensatory cavity in the partner CH3 domain.

[0292] In some embodiments, the heterodimeric molecule contains a T366W mutation in the CH3 domain of the “knobs chain” and T366S, L368A, Y407V mutations in the CH3 domain of the “hole chain”. In some cases, an additional interchain disulfide bridge between the CH3 domains can also be used (Merchant, A. M., et al., *Nature Biotech.* 16 (1998) 677-681) e.g. by introducing a Y349C mutation into the CH3 domain of the “knobs” or “hole” chain and a E356C mutation or a S354C mutation into the CH3 domain of the other chain. In some embodiments,

the heterodimeric molecule contains S354C, T366W mutations in one of the two CH3 domains and Y349C, T366S, L368A, Y407V mutations in the other of the two CH3 domains. For example, the knob Fc may contain the sequence set forth in SEQ ID NO: 89, containing S354C and T366W, and a hole Fc set forth in SEQ ID NO: 90, containing mutations Y349C, T366S, L368A and Y407V). In some embodiments, the heterodimeric molecule comprises E356C, T366W mutations in one of the two CH3 domains and Y349C, T366S, L368A, Y407V mutations in the other of the two CH3 domains. In some embodiments, the heterodimeric molecule comprises Y349C, T366W mutations in one of the two CH3 domains and E356C, T366S, L368A, Y407V mutations in the other of the two CH3 domains. In some embodiments, the heterodimeric molecule comprises Y349C, T366W mutations in one of the two CH3 domains and S354C, T366S, L368A, Y407V mutations in the other of the two CH3 domains. Examples of other knobs-in-holes technologies are known in the art, e.g. as described by EP 1 870 459 A1.

[0293] In some embodiments, an Fc variant containing CH3 protuberance (knob) or cavity(hole) modifications can be joined to a multi-domain immunomodulatory polypeptide anywhere, but typically via its N- or C-terminus, to the N- or C-terminus of the one or more TACI polypeptide sequence (e.g. variant TACI polypeptide sequence), such as to form a fusion polypeptide. The linkage can be direct or indirect via a linker. Typically, a knob and hole molecule is generated by co-expression of a first immunomodulatory polypeptide linked to an Fc variant containing CH3 protuberance modification(s) with a second immunomodulatory polypeptide linked to an Fc variant containing CH3 cavity modification(s).

[0294] Exemplary sequences for knob and hole Fc polypeptides are set forth in SEQ ID NOs: 128, and 129, respectively. In some embodiments, the knob or hold Fc region lacks the C-terminal lysine corresponding to position 232 of the wild-type or unmodified Fc set forth in SEQ ID NO: 71 (corresponding to K447del by EU numbering). Exemplary sequences for knob and hole Fc polypeptides are set forth in SEQ ID NOs: 89 and 90, respectively.

[0295] In some embodiment, individual polypeptide of a multi-domain polypeptide or individual polypeptides of a single-domain polypeptide are linked to a multimerization domain that forms an immunomodulatory protein is a trimer, tetramer or pentamer. In some embodiments, the individual polypeptides of such a molecule are the same. In some embodiments, such a multimerization domain is a cartilage oligomeric matrix protein (COMP) assembly domain, a vasodilator-stimulated phosphoprotein (VASP) tetramerization domain or a ZymoZipper (ZZ) 12.6 domain.

[0296] In some embodiments, the multimerization domain is a portion of the cartilage oligomeric matrix protein (COMP) assembly domain (Voulgaraki et al., Immunology (2005) 115(3):337-346. In some examples, the COMP is or contains an amino acid sequence as set forth in SEQ ID NO: 146 (e.g. amino acids 29-72 of the full length COMP, Uniprot accession number P49747) or a sequence that has about 85%, 85%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to SEQ ID NO: 146.

[0297] In some embodiments, the multimerization domain is a vasodilator-stimulated phosphoprotein (VASP) tetramerization domain (Bachmann et al., J Biol Chem (1999) 274(33):23549-23557). In some embodiments, the VASP is or contains an amino acid sequence as set forth in SEQ ID NO: 147 (e.g. amino acids 343-375 of the full length VASP; Uniprot accession number P50552) or a sequence that has about 85%, 85%, 87%, 88%, 89%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity to SEQ ID NO: 147.

[0298] In some embodiments, a TACI polypeptide sequence (e.g. variant TACI polypeptide sequence) is joined to the multimerization domain (e.g. Fc region) via a linker, such as a peptide linker. In some embodiments, a peptide linker can be a single amino acid residue or greater in length. In some embodiments, the peptide linker has at least one amino acid residue but is no more than 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, or 1 amino acid residues in length.

[0299] In some embodiments, the linker is (in one-letter amino acid code): GGGGS ("4GS"; SEQ ID NO: 77) or multimers of the 4GS linker, such as repeats of 2, 3, 4, or 5 4GS linkers. In some embodiments, the peptide linker is the peptide linker is (GGGGS)₂ (SEQ ID NO: 78), (GGGGS)₃ (SEQ ID NO: 79), (GGGGS)₄ (SEQ ID NO: 84) or (GGGGS)₅ (SEQ ID NO: 91). In some embodiments, the linker also can include a series of alanine residues alone or in addition to another peptide linker (such as a 4GS linker or multimer thereof). In some embodiments, the linker (in one-letter amino acid code) is GSGGGGS (SEQ ID NO: 74) or GGGGSSA (SEQ ID NO: 80). In some examples, the linker is a 2xGGGGS followed by three alanines (GGGGSGGGGSAAA; SEQ ID NO:133). In some examples, the linker is set forth in SEQ ID NO: 194 or 195.

[0300] In some embodiments, the TACI polypeptide, such as the variant TACI polypeptide, is directly linked to the Fc sequence. In some embodiments, the TACI polypeptide, such as the variant TACI polypeptide, is indirectly linked to the Fc sequence, such as via a linker. In some embodiments, one or more "peptide linkers" link the TACI polypeptide (e.g. variant TACI polypeptide) and the Fc region. In some embodiments, a peptide linker can be a single amino

acid residue or greater in length. In some embodiments, the peptide linker has at least one amino acid residue but is no more than 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, or 1 amino acid residues in length. Exemplary linkers include any linker as described herein.

[0301] In some embodiments, the TACI-Fc fusion protein has the structure TACI polypeptide (TACI)-Linker-Fc region. In some embodiments, the immunomodulatory protein is a homodimer of two identical copies of the TACI-Fc fusion protein. For instance, interactions between Fc regions of the two identical polypeptide fusions form covalent disulfide bonds to result in a dimeric molecule containing two TACI polypeptides (e.g. two variant TACI polypeptides).

[0302] In some embodiments, there is provided a TACI-Fc fusion protein containing in order a TACI polypeptide, e.g. any as described above, a linker and an Fc region. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a truncated wild-type TACI polypeptide, such as any as described. In some embodiments, the TACI polypeptide of the TACI Fc fusion is set forth in SEQ ID NO: 13. The linker may be any as described. In some embodiments, the linker is GSGGGGS (SEQ ID NO: 74). In some embodiments, the linker is GS(G4S)₂ (SEQ ID NO: 194). The Fc region may be any Fc region as described. In some embodiments, the Fc region is a wild-type IgG1 Fc set forth in SEQ ID NO:81. In some embodiments, the Fc region is a variant Fc set forth in SEQ ID NO: 73.

[0303] In some embodiments, the TACI-Fc fusion protein has the sequence set forth in SEQ ID NO:171. In some embodiments, the TACI-Fc fusion protein has the sequence set forth in SEQ ID NO:197. In some embodiments, the TACI-Fc fusion is encoded by the sequence set forth in SEQ ID NO:208.

[0313] In some embodiments, the TACI-Fc fusion protein contains multiple copies of a TACI polypeptide sequence (e.g. variant TACI-polypeptide sequence), such as 2, 3 or 4 TACI polypeptide sequences. In some embodiments, the TACI-Fc fusion proteins contains two TACI polypeptide sequences (e.g. two variant TACI polypeptide sequences). In some cases, the TACI polypeptide sequences may be linked directly or may be linked indirectly via a linker, such as a peptide linker including any as described. In such an example, one of the TACI polypeptide sequence is joined or linked to the Fc region, such as either to the N- or C-terminus of the Fc region. In other cases, the TACI polypeptide sequences may be separated from each other by the Fc region and each joined individually to the N- or C-terminus of the Fc region. The linkage

to the Fc region may be direct or may be indirect via a linker, such as a peptide linker including any as described.

[0314] In some embodiments, the TACI polypeptide sequences (e.g. variant TACI polypeptide sequences) may be arranged in order in the fusion protein in tandem (hereinafter called a “tandem” Fc fusion construct). In some embodiments, the TACI-Fc fusion protein has the structure: (TACI)-Linker-(TACI)-Linker-Fc region. In some embodiments, the immunomodulatory protein is a tetravalent molecule that is a homodimer of two identical copies of the TACI-Fc fusion protein. For instance, interactions between Fc regions of the two identical polypeptide fusions form covalent disulfide bonds to result in a dimeric molecule containing four TACI polypeptides (e.g. four variant TACI polypeptides).

[0315] In some embodiments, there is provided a TACI-Fc fusion protein containing in order a TACI polypeptide, e.g. any as described above; a linker; another TACI polypeptide, e.g. any as described; and an Fc region. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a truncated wild-type TACI polypeptide, such as any as described. In some embodiments, each TACI polypeptide of the TACI Fc fusion is set forth in SEQ ID NO: 13. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a variant TACI polypeptide, such as any as described. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a variant TACI set forth in any one of SEQ ID NOS: 2-12, 21, 22, or 101-120. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a variant TACI set forth in any one of SEQ ID NOS: 14-20, 23-35, 92-100 or 177-192. The linkers may be any as described. In some embodiments, the linker is GSGGGGS (SEQ ID NO: 74). The Fc region may be any Fc region as described. In some embodiments, the Fc region is a wild-type IgG1 Fc set forth in SEQ ID NO:81. In some embodiments, the Fc region is a variant Fc set forth in SEQ ID NO: 73. In some embodiments, the TACI-Fc fusion protein has the sequence set forth in SEQ ID NO:198, and encoded by a sequence set forth in SEQ ID NO:209.

[0316] In some embodiments, the TACI polypeptide sequences (e.g. variant TACI polypeptide sequences) may be separated in the fusion protein by the Fc region in which the Fc region is positioned between the two TACI polypeptide sequences (hereinafter called a “barbell” Fc fusion construct). In some embodiments, the TACI-Fc fusion protein has the structure: (TACI)-Linker-Fc region-Linker-(TACI). In some embodiments, the linkers may be the same or different. In some embodiments, the immunomodulatory protein is a tetravalent molecule that is a homodimer of two identical copies of the TACI-Fc fusion protein. For instance, interactions between Fc regions of the two identical polypeptide fusions form covalent disulfide bonds to

result in a dimeric molecule containing four TACI polypeptides (e.g. four variant TACI polypeptides).

[0317] In some embodiments, there is provided a TACI-Fc fusion protein containing in order a TACI polypeptide, e.g. any as described above; a linker; an Fc region; a linker; and another TACI polypeptide, e.g. any as described. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a truncated wild-type TACI polypeptide, such as any as described. In some embodiments, each TACI polypeptide of the TACI Fc fusion is set forth in SEQ ID NO: 13. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a variant TACI polypeptide, such as any as described. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a variant TACI set forth in any one of SEQ ID NOS: 2-12, 21, 22, or 101-120. In some embodiments, each TACI polypeptide of the TACI Fc fusion is a variant TACI set forth in any one of SEQ ID NOS: 14-20, 23-35, 92-100 or 177-192. The linkers may be any as described, and may be the same or different. In some embodiments, the first linker is GSGGGGS (SEQ ID NO: 74) and the second linker is (GGGGS)₄ (SEQ ID NO: 84). The Fc region may be any Fc region as described. In some embodiments, the Fc region is a wild-type IgG1 Fc set forth in SEQ ID NO:81. In some embodiments, the Fc region is a variant Fc set forth in SEQ ID NO: 73. In some embodiments, the TACI-Fc fusion protein has the sequence set forth in SEQ ID NO:201, and encoded by a sequence set forth in SEQ ID NO:212. In some embodiments, the TACI-Fc fusion protein has the sequence set forth in SEQ ID NO:202, and encoded by a sequence set forth in SEQ ID NO:213.

[0318] In some embodiments, there is provided a TACI-Fc fusion protein that is a dimer formed by two identical TACI polypeptides (e.g. variant TACI polypeptide) as described linked to an Fc domain. In some embodiments, identical species (also referred to as copies) of any of the provided TACI-Fc fusion polypeptides, e.g. variant TACI-Fc fusion, will be dimerized to create a homodimer. In some embodiments, the dimer is a homodimer in which the two TACI-Fc polypeptides, e.g. variant TACI-Fc polypeptides, are the same. For generating a homodimeric Fc molecule, the Fc region is one that is capable of forming a homodimer with a matched Fc region by co-expression of the individual Fc regions in a cell. In some embodiments, dimerization is mediated by covalent disulfide bond(s) formed between the Fc regions of the polypeptide fusions.

[0319] Also provided are nucleic acid molecules encoding the immunomodulatory protein. In some embodiments, for production of immunomodulatory protein, a nucleic acid molecule encoding the immunomodulatory protein is inserted into an appropriate expression vector. The

resulting immunomodulatory protein can be expressed in host cells transformed with the expression where assembly between Fc domains occurs by interchain disulfide bonds formed between the Fc moieties to yield dimeric, such as divalent, immunomodulatory proteins.

[0320] Also provided are nucleic acid molecules encoding the TACI-Fc fusion proteins, e.g. variant TACI-Fc fusion protein. In some embodiments, for production of an Fc fusion protein, a nucleic acid molecule encoding a TACI-Fc fusion protein, e.g. variant TACI-Fc fusion protein is inserted into an appropriate expression vector. The resulting TACI-Fc fusion protein, e.g. variant TACI-Fc fusion protein can be expressed in host cells transformed with the expression where assembly between Fc domains occurs by interchain disulfide bonds formed between the Fc moieties to yield dimeric, such as divalent, TACI-Fc fusion proteins. The resulting Fc fusion proteins can be easily purified by affinity chromatography over Protein A or Protein G columns. For the generation of heterodimers, additional steps for purification can be necessary. For example, where two nucleic acids encoding different immunomodulatory proteins are transformed into cells, the formation of heterodimers must be biochemically achieved since immunomodulatory protein carrying the Fc-domain will be expressed as disulfide-linked homodimers as well. Thus, homodimers can be reduced under conditions that favor the disruption of interchain disulfides, but do no effect intra-chain disulfides. In some cases, different immunomodulatory protein monomers are mixed in equimolar amounts and oxidized to form a mixture of homo- and heterodimers. The components of this mixture are separated by chromatographic techniques. Alternatively, the formation of this type of heterodimer can be biased by genetically engineering and expressing immunomodulatory proteins containing Fc fusion molecules that contain one or more TACI variants using knob-into-hole methods as described.

[0321] In embodiments, when produced and expressed from a cells, the provided immunomodulatory protein, such as a TACI-Fc (e.g. variant TACI-Fc), is a homodimer containing two identical polypeptide chains. **FIG. 8A** and **FIG. 8B** depict the structure of exemplary TACI-Fc fusion proteins provided herein.

[0322] Provided herein is a TACI (26)-Fc₇₃ homodimer of two identical variant TACI-Fc fusion proteins containing a variant of the TACI Cysteine Rich Domain 2 (CRD2) set forth in SEQ ID NO:26 designed to neutralize the B-cell stimulatory activity of APRIL and BAFF. The TACI (26)-Fc₇₃ homodimer is a dimer consisting of 2 identical receptor Fc-fusion protein chains, each with a variant TACI CRD2 domain human Fc-fusion set forth in SEQ ID NO:167, linked by covalent disulfide bonds.

[0323] Provided herein is a TACI (26)-Fc₈₁ homodimer of two identical variant TACI-Fc fusion proteins containing a variant of the TACI Cysteine Rich Domain 2 (CRD2) set forth in SEQ ID NO:26 designed to neutralize the B-cell stimulatory activity of APRIL and BAFF. The TACI (26)-Fc₈₁ homodimer is a dimer consisting of 2 identical receptor Fc-fusion protein chains, each with a variant TACI CRD2 domain human Fc-fusion set forth in SEQ ID NO:168, linked by covalent disulfide bonds.

[0324] Provided herein is a TACI (27)-Fc₇₃ homodimer of two identical variant TACI-Fc fusion proteins containing a variant of the TACI Cysteine Rich Domain 2 (CRD2) set forth in SEQ ID NO:27 designed to neutralize the B-cell stimulatory activity of APRIL and BAFF. The TACI (27)-Fc₇₃ homodimer is a dimer consisting of 2 identical receptor Fc-fusion protein chains, each with a variant TACI CRD2 domain human Fc-fusion set forth in SEQ ID NO:169, linked by covalent disulfide bonds.

[0325] Provided herein is a TACI (27)-Fc₈₁ homodimer of two identical variant TACI-Fc fusion proteins containing a variant of the TACI Cysteine Rich Domain 2 (CRD2) set forth in SEQ ID NO:27 designed to neutralize the B-cell stimulatory activity of APRIL and BAFF. The TACI (27)-Fc₈₁ homodimer is a dimer consisting of 2 identical receptor Fc-fusion protein chains, each with a variant TACI CRD2 domain human Fc-fusion set forth in SEQ ID NO:170, linked by covalent disulfide bonds.

[0326] In some embodiments, provided TACI-Fc (e.g. variant TACI-Fc) fusion proteins, such as homodimers thereof, exhibit an IC₅₀ for neutralizing BAFF of less than 400 pM. In some embodiments, the IC₅₀ for neutralizing BAFF is between 1 pM and 400 pM, such as between 10 pM and 300 pM, between 10 pM and 200 pM, between 10 pM and 100 pM, between 10 pM and 50 pM, between 10 pM and 20 pM, between 20 pM and 400 pM, between 20 pM and 300 pM, between 20 pM and 200 pM, between 20 pM and 100 pM, between 20 pM and 50 pM, between 50 pM and 400 pM, between 50 pM and 300 pM, between 50 pM and 200 pM, between 50 pM and 100 pM, between 100 pM and 400 pM, between 100 pM and 300 pM, between 100 pM and 200 pM, between 200 pM and 400 pM, between 200 pM and 300 pM, or between 300 pM and 400 pM. In some embodiments, the IC₅₀ for neutralizing BAFF is at or about 10 pM, 15 pM, 20 pM, 25 pM, 30 pM, 35 pM, 40 pM, 45 pM, 50 pM, 55 pM, 60 pM, 65 pM, 70 pM, 75 pM, 80 pM, 85 pM, 90 pM, 95 pM or 100 pM or any value between any of the foregoing.

[0327] In some embodiments, provided TACI-Fc (e.g. variant TACI-Fc) fusion proteins, such as homodimers thereof, exhibits an IC₅₀ for neutralizing APRIL of less than 400 pM. In

some embodiments, the IC₅₀ for neutralizing APRIL is between 0.5 pM and 100 pM, such as between 0.5 pM and 50 pM, between 0.5 pM and 25 pM, between 0.5 pM and 10 pM, between 0.5 pM and 5 pM, between 0.5 pM and 1 pM, between 1 pM and 100 pM, between 1 pM and 50 pM, between 1 pM and 25 pM, between 1 pM and 10 pM, between 1 pM and 5 pM, between 5 pM and 100 pM, between 5 pM and 50 pM, between 5 pM and 25 pM, between 5 pM and 10 pM, between 10 pM and 100 pM, between 10 pM and 50 pM, between 10 pM and 25 pM, or between 25 pM and 100 pM, between 25 pM and 50 pM, or between 50 pM and 100 pM. In some embodiments, the IC₅₀ for neutralizing APRIL is at or about 0.5 pM, 0.75 pM, 1 pM, 2 pM, 3 pM, 4 pM, 5 pM, 6 pM, 7 pM, 8 pM, 9 pM, 10 pM, 11 pM, 12 pM, 13 pM, 14 pM, 15 pM, 20 pM or 25 pM or any value between any of the foregoing.

III. NUCLEIC ACIDS, VECTORS AND METHODS FOR PRODUCING THE POLYPEPTIDES OR CELLS

[0328] Provided herein are isolated or recombinant nucleic acids collectively referred to as “nucleic acids” which encode any of the immunomodulatory proteins provided herein. In some embodiments, nucleic acids provided herein, including all described below, are useful in recombinant production (e.g., expression) of immunomodulatory proteins provided herein. In some embodiments, nucleic acids provided herein, including all described below, are useful in expression of immunomodulatory proteins provided herein, such as TACI fusion proteins provided herein. The nucleic acids provided herein can be in the form of RNA or in the form of DNA, and include mRNA, cRNA, recombinant or synthetic RNA and DNA, and cDNA. The nucleic acids provided herein are typically DNA molecules, and usually double-stranded DNA molecules. However, single-stranded DNA, single-stranded RNA, double-stranded RNA, and hybrid DNA/RNA nucleic acids or combinations thereof comprising any of the nucleotide sequences of the invention also are provided.

[0329] In some cases, a heterologous (non-native) signal peptide can be added to the nucleic acid encoding the immunomodulatory protein. This may be desired, for example, in the case of expression of TACI fusion proteins, which do not contain an amino terminal signal sequence. In some embodiments, the signal peptide is a signal peptide from an immunoglobulin (such as IgG heavy chain or IgG-kappa light chain), a cytokine (such as interleukin-2 (IL-2), or CD33), a serum albumin protein (e.g. HSA or albumin), a human azurocidin preprotein signal sequence, a luciferase, a trypsinogen (e.g. chymotrypsinogen or trypsinogen) or other signal peptide able to

efficiently express and, in some aspects, secret a protein from a cell. Exemplary signal peptides include any described in the Table 3.

TABLE 3. Exemplary Signal Peptides		
SEQ ID NO	Signal Peptide	Peptide Sequence
SEQ ID NO: 149	HSA signal peptide	MKWVTFISLLFLFSSAYS
SEQ ID NO: 150	Ig kappa light chain	MDMRAPAGIFGFLLVLPFYRS
SEQ ID NO: 151	human azurocidin preprotein signal sequence	MTRLTVLALLAGLLASSRA
SEQ ID NO: 152	IgG heavy chain signal peptide	MELGLSWIFLLAILKGVQC
SEQ ID NO: 153	IgG heavy chain signal peptide	MELGLRWVFLVAILEGVQC
SEQ ID NO: 154	IgG heavy chain signal peptide	MKHLWFFLLLVAAPRWVLS
SEQ ID NO: 155	IgG heavy chain signal peptide	MDWTWRILFLVAAATGAHS
SEQ ID NO: 156	IgG heavy chain signal peptide	MDWTWRFLFVVAATGVQS
SEQ ID NO: 157	IgG heavy chain signal peptide	MEFGLSWLFLVAILKGVQC
SEQ ID NO: 158	IgG heavy chain signal peptide	MEFGLSWVFLVALFRGVQC
SEQ ID NO: 159	IgG heavy chain signal peptide	MDLLHKNMKHLWFFLLLVAAPRWVLS
SEQ ID NO: 160	IgG Kappa light chain signal sequences:	MDMRVPAQLLGLLLWLSGAR
SEQ ID NO: 161	IgG Kappa light chain signal sequences:	MKYLLPTAAAGLLLLAAQPAM
SEQ ID NO: 162	Gaussia luciferase	MGVKVLFALICIAVAEA
SEQ ID NO: 163	Human albumin	MKWVTFISLLFLFSSAYS
SEQ ID NO: 164	Human chymotrypsinogen	MAFLWLLSCWALLGTTFG
SEQ ID NO: 165	Human interleukin-2	MQLLSCIALILALV
SEQ ID NO: 166	Human trypsinogen-2	MNLLLILTFVAAAVA

[0330] In some embodiments, the immunomodulatory protein comprises a signal peptide when expressed, and the signal peptide (or a portion thereof) is cleaved from the immunomodulatory protein upon secretion.

[0331] Also provided herein are recombinant expression vectors and recombinant host cells useful in producing the immunomodulatory proteins, such as TACI fusion proteins provided herein.

[0332] In any of the above provided embodiments, the nucleic acids encoding the immunomodulatory polypeptides provided herein can be introduced into cells using recombinant DNA and cloning techniques. To do so, a recombinant DNA molecule encoding an immunomodulatory polypeptide is prepared. Methods of preparing such DNA molecules are well known in the art. For instance, sequences coding for the peptides could be excised from DNA using suitable restriction enzymes. Alternatively, the DNA molecule could be synthesized using chemical synthesis techniques, such as the phosphoramidite method. Also, a combination

of these techniques could be used. In some instances, a recombinant or synthetic nucleic acid may be generated through polymerase chain reaction (PCR). A DNA insert encoding an immunomodulatory protein can be cloned into an appropriate transduction/transfection vector as is known to those of skill in the art. Also provided are expression vectors containing the nucleic acid molecules.

[0333] In some embodiments, the expression vectors are capable of expressing the immunomodulatory proteins in an appropriate cell under conditions suited to expression of the protein. In some aspects, nucleic acid molecule or an expression vector comprises the DNA molecule that encodes the immunomodulatory protein operatively linked to appropriate expression control sequences. Methods of effecting this operative linking, either before or after the DNA molecule is inserted into the vector, are well known. Expression control sequences include promoters, activators, enhancers, operators, ribosomal binding sites, start signals, stop signals, cap signals, polyadenylation signals, and other signals involved with the control of transcription or translation.

[0334] In some embodiments, expression of the immunomodulatory protein is controlled by a promoter or enhancer to control or regulate expression. The promoter is operably linked to the portion of the nucleic acid molecule encoding the variant polypeptide or immunomodulatory protein.

[0335] The resulting recombinant expression vector having the DNA molecule thereon is used to transform an appropriate host. This transformation can be performed using methods well known in the art. In some embodiments, a nucleic acid provided herein further comprises nucleotide sequence that encodes a secretory or signal peptide operably linked to the nucleic acid encoding an immunomodulatory polypeptide such that a resultant soluble immunomodulatory polypeptide is recovered from the culture medium, host cell, or host cell periplasm. In other embodiments, the appropriate expression control signals are chosen to allow for membrane expression of an immunomodulatory polypeptide. Furthermore, commercially available kits as well as contract manufacturing companies can also be utilized to make engineered cells or recombinant host cells provided herein.

[0336] In some embodiments, the resulting expression vector having the DNA molecule thereon is used to transform, such as transduce, an appropriate cell. The introduction can be performed using methods well known in the art. Exemplary methods include those for transfer of nucleic acids encoding the receptors, including via viral, e.g., retroviral or lentiviral, transduction, transposons, and electroporation. In some embodiments, the expression vector is a

viral vector. In some embodiments, the nucleic acid is transferred into cells by lentiviral or retroviral transduction methods.

[0337] Any of a large number of publicly available and well-known mammalian host cells, including mammalian T-cells or APCs, can be used in the preparing the polypeptides or engineered cells. The selection of a cell is dependent upon a number of factors recognized by the art. These include, for example, compatibility with the chosen expression vector, toxicity of the peptides encoded by the DNA molecule, rate of transformation, ease of recovery of the peptides, expression characteristics, bio-safety and costs. A balance of these factors must be struck with the understanding that not all cells can be equally effective for the expression of a particular DNA sequence.

[0338] In some embodiments, the host cell is a mammalian cell. Examples of suitable mammalian host cells include African green monkey kidney cells (Vero; ATCC CRL 1587), human embryonic kidney cells (293-HEK; ATCC CRL 1573), baby hamster kidney cells (BHK-21, BHK-570; ATCC CRL 8544, ATCC CRL 10314), canine kidney cells (MDCK; ATCC CCL 34), Chinese hamster ovary cells (CHO-K1; ATCC CCL61; CHO DG44 (Chasin et al, Som. Cell. Molec. Genet. 12:555, 1986)), rat pituitary cells (GH1; ATCC CCL82), HeLa S3 cells (ATCC CCL2.2), rat hepatoma cells (H-4-II-E; ATCC CRL 1548) SV40- transformed monkey kidney cells (COS-1; ATCC CRL 1650) and murine embryonic cells (NIH-3T3; ATCC CRL 1658).

[0339] In some embodiments, the host cells can be a variety of eukaryotic cells, such as in yeast cells, or with mammalian cells such as Chinese hamster ovary (CHO) or HEK293 cells. In some embodiments, the host cell is a suspension cell and the polypeptide is engineered or produced in cultured suspension, such as in cultured suspension CHO cells, e.g. CHO-S cells. In some examples, the cell line is a CHO cell line that is deficient in DHFR (DHFR-), such as DG44 and DUXB11. In some embodiments, the cell is deficient in glutamine synthase (GS), e.g. CHO-S cells, CHOK1 SV cells, and CHOZN((R)) GS-/- cells. In some embodiments, the CHO cells, such as suspension CHO cells, may be CHO-S-2H2 cells, CHO-S-clone 14 cells, or ExpiCHO-S cells.

[0340] In some embodiments, host cells can also be prokaryotic cells, such as with *E. coli*. The transformed recombinant host is cultured under polypeptide expressing conditions, and then purified to obtain a soluble protein. Recombinant host cells can be cultured under conventional fermentation conditions so that the desired polypeptides are expressed. Such fermentation conditions are well known in the art. Finally, the polypeptides provided herein can be recovered

and purified from recombinant cell cultures by any of a number of methods well known in the art, including ammonium sulfate or ethanol precipitation, acid extraction, anion or cation exchange chromatography, phosphocellulose chromatography, hydrophobic interaction chromatography, and affinity chromatography. Protein refolding steps can be used, as desired, in completing configuration of the mature protein. Finally, high performance liquid chromatography (HPLC) can be employed in the final purification steps.

[0341] In some embodiments, the recombinant vector is a viral vector. Exemplary recombinant viral vectors include a lentiviral vector genome, poxvirus vector genome, vaccinia virus vector genome, adenovirus vector genome, adenovirus-associated virus vector genome, herpes virus vector genome, and alpha virus vector genome. Viral vectors can be live, attenuated, replication conditional or replication deficient, non-pathogenic (defective), replication competent viral vector, and/or is modified to express a heterologous gene product, e.g., the variant immunomodulatory polypeptides provided herein. Vectors for generation of viruses also can be modified to alter attenuation of the virus, which includes any method of increasing or decreasing the transcriptional or translational load.

[0342] Exemplary viral vectors that can be used include modified vaccinia virus vectors (see, e.g., Guerra et al., *J. Virol.* 80:985-98 (2006); Tartaglia et al., *AIDS Research and Human Retroviruses* 8: 1445-47 (1992); Gheradi et al., *J. Gen. Virol.* 86:2925-36 (2005); Mayr et al., *Infection* 3:6-14 (1975); Hu et al., *J. Virol.* 75: 10300-308 (2001); U.S. Patent Nos. 5,698,530, 6,998,252, 5,443,964, 7,247,615 and 7,368,116); adenovirus vector or adenovirus-associated virus vectors (see, e.g., Molin et al., *J. Virol.* 72:8358-61 (1998); Narumi et al., *Am J. Respir. Cell Mol. Biol.* 19:936-41 (1998); Mercier et al., *Proc. Natl. Acad. Sci. USA* 101:6188-93 (2004); U.S. Patent Nos. 6,143,290; 6,596,535; 6,855,317; 6,936,257; 7,125,717; 7,378,087; 7,550,296); retroviral vectors including those based upon murine leukemia virus (MuLV), gibbon ape leukemia virus (GaLV), ecotropic retroviruses, simian immunodeficiency virus (SIV), human immunodeficiency virus (HIV), and combinations (see, e.g., Buchscher et al., *J. Virol.* 66:2731-39 (1992); Johann et al., *J. Virol.* 66: 1635-40 (1992); Sommerfelt et al., *Virology* 176:58-59 (1990); Wilson et al., *J. Virol.* 63:2374-78 (1989); Miller et al., *J. Virol.* 65:2220-24 (1991); Miller et al., *Mol. Cell Biol.* 10:4239 (1990); Kolberg, *NIH Res.* 4:43 1992; Cornetta et al., *Hum. Gene Ther.* 2:215 (1991)); lentiviral vectors including those based upon Human Immunodeficiency Virus (HIV-1), HIV-2, feline immunodeficiency virus (FIV), equine infectious anemia virus, Simian Immunodeficiency Virus (SIV), and maedi/visna virus (see, e.g., Pfeifer et al., *Annu. Rev. Genomics Hum. Genet.* 2: 177-211 (2001); Zufferey et al., *J. Virol.* 72:

9873, 1998; Miyoshi et al., J. Virol. 72:8150, 1998; Philpott and Thrasher, Human Gene Therapy 18:483, 2007; Engelman et al., J. Virol. 69: 2729, 1995; Nightingale et al., Mol. Therapy, 13: 1121, 2006; Brown et al., J. Virol. 73:9011 (1999); WO 2009/076524; WO 2012/141984; WO 2016/011083; McWilliams et al., J. Virol. 77: 11150, 2003; Powell et al., J. Virol. 70:5288, 1996) or any, variants thereof, and/or vectors that can be used to generate any of the viruses described above. In some embodiments, the recombinant vector can include regulatory sequences, such as promoter or enhancer sequences, that can regulate the expression of the viral genome, such as in the case for RNA viruses, in the packaging cell line (see, e.g., U.S. Patent Nos. 5,385,839 and 5,168,062).

[0343] In some aspects, nucleic acids or an expression vector comprises a nucleic acid sequence that encodes the immunomodulatory protein operatively linked to appropriate expression control sequences. Methods of effecting this operative linking, either before or after the nucleic acid sequence encoding the immunomodulatory protein is inserted into the vector, are well known. Expression control sequences include promoters, activators, enhancers, operators, ribosomal binding sites, start signals, stop signals, cap signals, polyadenylation signals, and other signals involved with the control of transcription or translation. The promoter can be operably linked to the portion of the nucleic acid sequence encoding the immunomodulatory protein.

[0344] Transcriptional regulatory sequences include a promoter region sufficient to direct the initiation of RNA synthesis. Suitable eukaryotic promoters include the promoter of the mouse metallothionein I gene (Hamer et al, J. Molec. Appl Genet. 1:273 (1982)), the TK promoter of Herpes virus (McKnight, Cell 31:355 (1982)), the SV40 early promoter (Benoist et al, Nature 290:304 (1981)), the Rous sarcoma virus promoter (Gorman et al, Proc. Nat'l Acad. Sci. USA 79:6777 (1982)), the cytomegalovirus promoter (Foecking et al, Gene 45:101 (1980)), and the mouse mammary tumor virus promoter (see, generally, Etcheverry, "Expression of Engineered Proteins in Mammalian Cell Culture," in Protein Engineering: Principles and Practice, Cleland et al. (eds.), pages 163-181 (John Wiley & Sons, Inc. 1996)). One useful combination of a promoter and enhancer is provided by a myeloproliferative sarcoma virus promoter and a human cytomegalovirus enhancer.

[0345] Alternatively, a prokaryotic promoter, such as the bacteriophage T3 RNA polymerase promoter, can be used to control production of an immunomodulatory protein in mammalian cells if the prokaryotic promoter is regulated by a eukaryotic promoter (Zhou et al, Mol Cell. Biol. 10:4529 (1990), and Kaufman et al, Nucl. Acids Res. 19:4485 (1991)).

[0346] An expression vector can be introduced into host cells using a variety of standard techniques including calcium phosphate transfection, liposome-mediated transfection, microprojectile-mediated delivery, electroporation, and the like. The transfected cells can be selected and propagated to provide recombinant host cells that comprise the expression vector stably integrated in the host cell genome. Techniques for introducing vectors into eukaryotic cells and techniques for selecting such stable transformants using a dominant selectable marker are described, for example, by Ausubel (1995) and by Murray (ed.), *Gene Transfer and Expression Protocols* (Humana Press 1991).

[0347] For example, one suitable selectable marker is a gene that provides resistance to the antibiotic neomycin. In this case, selection is carried out in the presence of a neomycin-type drug, such as G-418 or the like. Selection systems can also be used to increase the expression level of the gene of interest, a process referred to as "amplification." Amplification is carried out by culturing transfectants in the presence of a low level of the selective agent and then increasing the amount of selective agent to select for cells that produce high levels of the products of the introduced genes. A suitable amplifiable selectable marker is dihydrofolate reductase, which confers resistance to methotrexate. Other drug resistance genes (e.g., hygromycin resistance, multi-drug resistance, puromycin acetyltransferase) can also be used. Alternatively, markers that introduce an altered phenotype, such as green fluorescent protein, or cell surface proteins such as CD4, CD8, Class I MHC, placental alkaline phosphatase may be used to sort transfected cells from untransfected cells by such means as FACS sorting or magnetic bead separation technology.

[0348] In some embodiments, polypeptides provided herein can also be made by synthetic methods. Solid phase synthesis is the preferred technique of making individual peptides since it is the most cost-effective method of making small peptides. For example, well known solid phase synthesis techniques include the use of protecting groups, linkers, and solid phase supports, as well as specific protection and deprotection reaction conditions, linker cleavage conditions, use of scavengers, and other aspects of solid phase peptide synthesis. Peptides can then be assembled into the polypeptides as provided herein.

IV. PHARMACEUTICAL COMPOSITIONS

[0349] Provided herein are compositions containing any of the provided immunomodulatory proteins (e.g. TACI-Fc fusion protein) described herein. In some embodiments, the pharmaceutical compositions comprise a therapeutically effective amount of a TACI-Fc fusion

protein as described provided as a formulation with a pharmaceutically acceptable diluent, carrier, solubilizer, emulsifier, preservative, and/or adjuvant. Also provided are any of the provided pharmaceutical compositions, including any of the provided formulations, for use in treating an autoimmune or inflammatory disease in a patient in need thereof, such as any uses for treating such diseases or conditions as described in Section V. Also provided are methods of treating an autoimmune or inflammatory disease in a patient in need thereof by administering any of such pharmaceutical compositions or formulations, such as for treating any disease or conditions as described in Section V.

[0350] The pharmaceutical composition can further comprise a pharmaceutically acceptable excipient. For example, the pharmaceutical composition can contain one or more excipients for modifying, maintaining or preserving, for example, the pH, osmolarity, viscosity, clarity, color, isotonicity, odor, sterility, stability, rate of dissolution or release, adsorption, or penetration of the composition. Such compositions may comprise buffers such as neutral buffered saline, phosphate buffered saline and the like; carbohydrates such as glucose, mannose, sucrose or dextrans, mannitol; proteins; polypeptides or amino acids such as glycine; antioxidants; chelating agents such as EDTA or glutathione; adjuvants (e.g., aluminum hydroxide); and preservatives.

[0351] In some embodiments, the pharmaceutical composition is a solid, such as a powder, capsule, or tablet. For example, the components of the pharmaceutical composition can be lyophilized. In some embodiments, the solid pharmaceutical composition is reconstituted or dissolved in a liquid prior to administration.

[0352] In some embodiments, the pharmaceutical composition is a liquid, for example immunomodulatory proteins (e.g. TACI-Fc fusion protein) dissolved in an aqueous solution (such as physiological saline or Ringer's solution). In some embodiments, the pH of the pharmaceutical composition is between about 4.0 and about 8.5 (such as between about 4.0 and about 5.0, between about 4.5 and about 5.5, between about 5.0 and about 6.0, between about 5.5 and about 6.5, between about 6.0 and about 7.0, between about 6.5 and about 7.5, between about 7.0 and about 8.0, or between about 7.5 and about 8.5).

[0353] In some embodiments, the pharmaceutical composition comprises a pharmaceutically-acceptable excipient, for example a filler, binder, coating, preservative, lubricant, flavoring agent, sweetening agent, coloring agent, a solvent, a buffering agent, a chelating agent, or stabilizer. Examples of pharmaceutically-acceptable fillers include cellulose, dibasic calcium phosphate, calcium carbonate, microcrystalline cellulose, sucrose, lactose,

glucose, mannitol, sorbitol, maltol, pregelatinized starch, corn starch, or potato starch. Examples of pharmaceutically-acceptable binders include polyvinylpyrrolidone, starch, lactose, xylitol, sorbitol, maltitol, gelatin, sucrose, polyethylene glycol, methyl cellulose, or cellulose. Examples of pharmaceutically-acceptable coatings include hydroxypropyl methylcellulose (HPMC), shellac, corn protein zein, or gelatin. Examples of pharmaceutically-acceptable disintegrants include polyvinylpyrrolidone, carboxymethyl cellulose, or sodium starch glycolate. Examples of pharmaceutically-acceptable lubricants include polyethylene glycol, magnesium stearate, or stearic acid. Examples of pharmaceutically-acceptable preservatives include methyl parabens, ethyl parabens, propyl paraben, benzoic acid, or sorbic acid. Examples of pharmaceutically-acceptable sweetening agents include sucrose, saccharine, aspartame, or sorbitol. Examples of pharmaceutically-acceptable buffering agents include carbonates, citrates, gluconates, acetates, phosphates, or tartrates.

[0354] In certain embodiments, the primary vehicle or carrier in a pharmaceutical composition may be either aqueous or non-aqueous in nature. For example, a suitable vehicle or carrier may be water for injection, physiological saline solution, or buffered saline. In some embodiments, pharmaceutical compositions comprise Tris buffer of about pH 7.0-8.5. In some embodiments, pharmaceutical composition comprise acetate buffer of about pH 4.0-6.0. The formulation can contain a concentration of buffer having sufficient buffering capacity to maintain a selected pH of the formulation at a selected temperature. In various embodiments, the concentration of the buffering solution can be from about 1 mM to about 100 mM, from about 2 mM to about 50 mM, from about 3mM to about 30 mM, from about 4 mM to about 20 mM, or from about 5 mM to about 10 mM, or from about 10 mM to about 40 mM, from about 15 mM to about 35 mM, from about 20 mM to about 30 mM, from about 25 mM to about 35 mM about.

[0355] In some embodiments, the buffered solution contains acetate at a concentration of from about 1 mM to about 100 mM, from about 2 mM to about 50 mM, from about 3mM to about 30 mM, from about 4 mM to about 20 mM, or from 5 mM to 15 mM, or from about 5 mM to about 10 mM, or from about 10 mM to about 40 mM, from about 15 mM to about 35 mM, from about 20 mM to about 30 mM, from about 25 mM to about 35 mM about. In some embodiments, the buffered solution contains acetate at a concentration from 5 mM to 15 mM. In some embodiments, the buffered solution contains acetate at a concentration of at or about 5 mM, at or about 6 mM, at or about 7 mM, at or about 8 mM, at or about 9 mM, at or about 10 mM, at or about 11 mM, at or about 12 mM, at or about 13 mM, at or about 14 mM, or at or

about 15 mM, or any value between any of the foregoing. In some embodiments, the buffered solution contains acetate at a concentration of at or about 5 mM. In some embodiments, the buffered solution contains acetate at a concentration of at or about 10 mM. In some embodiments, the buffered solution contains acetate at a concentration of at or about 12 mM. In some embodiments, the buffered solution contains acetate at a concentration of at or about 15 mM. Exemplary pH ranges of a acetic acid (acetate) buffer and/or the final formulation can include pH ranges between about 4.0 to about 6.0, between about 4.5 to about 5.5, between about 4.8 to about 5.2 or about 5.0. Accordingly, an acetic acid (acetate) buffer and/or the final formulation can be prepared to have a pH of about about 4.0, about 4.5, about 4.8, about 5.0, about 5.2, about 5.5, about 5.7, or about 6.0, or any value between any of the foregoing. In some embodiments, the pH of the buffered solution is at or about 5.0. In some embodiments, the pH of the buffered solution is at or about 5.2. In some embodiments, the pH of the buffered solution is at or about 5.5. Those skilled in the art can determine the pH of a acetic acid (acetate) buffer in a formulation.

[0356] In certain embodiments, acceptable formulation materials are nontoxic to recipients at the dosages and concentrations employed. In certain embodiments, the pharmaceutical composition may contain formulation materials for modifying, maintaining or preserving, for example, the pH, osmolarity, viscosity, clarity, color, isotonicity, odor, sterility, stability, rate of dissolution or release, adsorption or penetration of the composition. In such embodiments, suitable formulation materials include, but are not limited to, amino acids (such as proline, glycine, glutamine, asparagine, arginine or lysine); antimicrobials; antioxidants (such as ascorbic acid, sodium sulfite or sodium hydrogen-sulfite); buffers (such as acetate, borate, bicarbonate, Tris-HCl, citrates, phosphates or other organic acids); bulking agents (such as mannitol or glycine); chelating agents (such as ethylenediamine tetraacetic acid (EDTA)); complexing agents (such as caffeine, polyvinylpyrrolidone, beta-cyclodextrin or hydroxypropyl-beta-cyclodextrin); fillers; monosaccharides; disaccharides; and other carbohydrates (such as glucose, mannose or dextrans); proteins (such as serum albumin, gelatin or immunoglobulins); coloring, flavoring and diluting agents; emulsifying agents; hydrophilic polymers (such as polyvinylpyrrolidone); low molecular weight polypeptides; salt-forming counterions (such as sodium); preservatives (such as benzalkonium chloride, benzoic acid, salicylic acid, thimerosal, phenethyl alcohol, methylparaben, propylparaben, chlorhexidine, sorbic acid or hydrogen peroxide); solvents (such as glycerin, propylene glycol or polyethylene glycol); sugar alcohols (such as mannitol or sorbitol); suspending agents; surfactants or wetting agents (such as

plurionics, PEG, sorbitan esters, polysorbates such as polysorbate 20, polysorbate 80, triton, tromethamine, lecithin, cholesterol, tyloxapal); stability enhancing agents (such as sucrose or sorbitol); tonicity enhancing agents (such as alkali metal halides, preferably sodium or potassium chloride, mannitol sorbitol); delivery vehicles; diluents; excipients and/or pharmaceutical adjuvants. See, REMINGTON'S PHARMACEUTICAL SCIENCES, 18th Edition, (A. R. Genrmo, ed.), 1990, Mack Publishing Company.

[0357] Free amino acids, such as but not limited to, lysine, proline, serine, and alanine can be used for stabilizing proteins in a provided formulation as bulking agents, stabilizers, and antioxidants, as well as other standard uses. In some embodiments, the free amino acid is present in the formulation at a concentration of about 1% to about 10% or 2% to 5%.

[0358] In some embodiments, the formulation contains proline as a free amino acid. In some embodiments, provided formulations contain proline at a concentration of about 1% to about 10%. In some embodiments, provided formulations contain proline at a concentration of about 2% to about 5%. In some embodiments, provided formulations contain proline at a concentration of at or about 1%, at or about 2%, at or about 3%, at or about 4%, at or about 5%, at or about 6%, at or about 7%, at or about 8%, at or about 9%, at or about 10%, or any value between any of the foregoing. In some embodiments, provided formulations contain proline at a concentration of about or about 2%. In some embodiments, provided formulations contain proline at a concentration of at or about 3%. In some embodiments, provided formulations contain proline at a concentration of at or about 4%.

[0359] Provided formulations may also further comprise surfactants. Protein molecules may be susceptible to adsorption on surfaces and to denaturation and consequent aggregation at air-liquid, solid-liquid, and liquid-liquid interfaces. These effects generally scale inversely with protein concentration. In some cases, the effects may be exacerbated by physical agitation, such as that generated during the shipping and handling of a product. Surfactants may be used to prevent, minimize, or reduce surface adsorption. A surfactant for inclusion in a formulation can be chosen, for example, to enhance or promote retention in stability of the protein molecule by preventing or reducing aggregation and/or adsorption. Sorbitan fatty acid esters such as the polysorbates are surfactants exhibiting a wide range of hydrophilic and emulsifying characteristics. They can be used individually or in combination with other surfactants to cover a wide range of stabilization needs. Such characteristics can be suitable for use with active protein agents because they can be tailored to cover the wide range of hydrophobic and hydrophilic characteristics of biopharmaceuticals. Useful surfactants include, but are not limited to,

polysorbate 20, polysorbate 80, other fatty acid esters of sorbitan polyethoxylates, and poloxamer 188.

[0360] Surfactant concentration for provided formulations can be less than about 1% (w/v). In this regard, surfactant concentrations generally can be used at ranges between about 0.001-0.10 % (w/v), between about 0.001-0.05 % (w/v), between about 0.001-0.025 % (w/v), between about 0.001-0.01 % (w/v), between about 0.005-0.10%, between about 0.005-0.05%, between about 0.005-0.025%, between about 0.005-0.01%, between about 0.01%-0.10%, between about 0.01%-0.05%, or between about 0.01% to 0.025%. Surfactant concentrations and/or amounts less than, greater than or in between these ranges also can also be used. Accordingly, a formulation can be produced that contains essentially any desired concentration or amount of one or more surfactants including, for example, about 0.001% (w/v), 0.002% (w/v), 0.003% (w/v), 0.004% (w/v), 0.005% (w/v), 0.006% (w/v), 0.007% (w/v), 0.008% (w/v), 0.009% (w/v), 0.010% (w/v), 0.015% (w/v), 0.02% (w/v), 0.025% (w/v), 0.03% (w/v), 0.04% (w/v), 0.05% (w/v), 0.06% (w/v), 0.07% (w/v), 0.08% (w/v), 0.09% (w/v) or 0.10% (w/v), or any value between any of the foregoing.

[0361] In some embodiments, the surfactant is polysorbate 80. In some embodiments, polysorbate 80 is at a concentration in the formulation of between about 0.001-0.10 % (w/v), between about 0.001-0.05 % (w/v), between about 0.001-0.025 % (w/v), between about 0.001-0.01 % (w/v), between about 0.005-0.10%, between about 0.005-0.05%, between about 0.005-0.025%, between about 0.005-0.01%, between about 0.01%-0.10%, between about 0.01%-0.05%, or between about 0.01% to 0.025%. In some embodiments, polysorbate 80 is present at a concentration of 0.001% (w/v), 0.002% (w/v), 0.003% (w/v), 0.004% (w/v), 0.005% (w/v), 0.006% (w/v), 0.007% (w/v), 0.008% (w/v), 0.009% (w/v), 0.010% (w/v), 0.015% (w/v), 0.02% (w/v), 0.025% (w/v), 0.03% (w/v), 0.04% (w/v), 0.05% (w/v), 0.06% (w/v), 0.07% (w/v), 0.08% (w/v), 0.09% (w/v) or 0.10% (w/v), or any value between any of the foregoing. In some embodiments, the concentration of polysorbate 80 is at or about 0.010% (w/v). In some embodiments, the concentration of polysorbate 80 is at or about 0.015% (w/v). In some embodiments, the concentration of polysorbate 80 is at or about 0.02% (w/v).

[0362] In some embodiments, the pharmaceutical composition further comprises an agent for the controlled or sustained release of the product, such as injectable microspheres, bio-erodible particles, polymeric compounds (polylactic acid, polyglycolic acid), beads, or liposomes.

[0363] In some embodiments, the pharmaceutical composition is sterile. Sterilization may be accomplished by filtration through sterile filtration membranes or radiation. Where the composition is lyophilized, sterilization using this method may be conducted either prior to or following lyophilization and reconstitution. The composition for parenteral administration may be stored in lyophilized form or in solution. In addition, parenteral compositions generally are placed into a container having a sterile access port, for example, an intravenous solution bag or vial having a stopper pierceable by a hypodermic injection needle.

[0364] A pharmaceutically acceptable carrier may be a pharmaceutically acceptable material, composition, or vehicle. For example, the carrier may be a liquid or solid filler, diluent, excipient, solvent, or encapsulating material, or some combination thereof. Each component of the carrier must be “pharmaceutically acceptable” in that it must be compatible with the other ingredients of the formulation. It also must be suitable for contact with any tissue, organ, or portion of the body that it may encounter, meaning that it must not carry a risk of toxicity, irritation, allergic response, immunogenicity, or any other complication that excessively outweighs its therapeutic benefits.

[0365] In some embodiments, the pharmaceutical composition is formulated to contain an amount of a TACI-Fc fusion of from at or about 1 mg to at or about 100 mg, such as from at or about 1 mg to at or about 75 mg, from at or about 1 mg to at or about 50 mg, from at or about 1 mg to at or about 25 mg, from at or about 1 mg to at or about 10 mg, from at or about 1 mg to at or about 5 mg, from at or about 5 mg to at or about 100 mg, from at or about 5 mg to at or about 75 mg, from at or about 5 mg to at or about 50 mg, from at or about 5 mg to at or about 25 mg, from at or about 5 mg to at or about 10 mg, from at or about 10 mg to at or about 100 mg, from at or about 10 mg to at or about 75 mg, from at or about 10 mg to at or about 50 mg, from at or about 10 mg to at or about 25 mg, from at or about 25 mg to at or about 100 mg, from at or about 25 mg to at or about 75 mg, from at or about 25 mg to at or about 50 mg, from at or about 50 mg to at or about 100 mg, from at or about 50 mg to at or about 75 mg or from at or about 75 mg to at or about 100 mg. In some embodiments, the pharmaceutical composition is formulated to contain an amount of a TACI-Fc fusion protein that is at or about 10 mg, at or about 20 mg, at or about 25 mg, at or about 30 mg, at or about 40 mg, at or about 50 mg, at or about 60 mg, at or about 70 mg, at or about 75 mg, at or about 80 mg or at or about 100 mg, or any value between any of the foregoing. In some embodiments, the pharmaceutical composition is formulated to contain an amount of a TACI-Fc fusion protein that is at or about 80 mg.

[0366] In some embodiments, the pharmaceutical composition is formulated in a volume that is from at or about 0.5 mL to at or about 10 mL, such as from at or about 0.5 mL to at or about 5 mL, from at or about 0.5 mL to at or about 2 mL, from at or about 0.5 mL to at or about 1 mL, from at or about 1 mL to at or about 10 mL, from at or about 1 mL to at or about 5 mL or from at or about 5 mL to at or about 10 mL. In some embodiments, the pharmaceutical composition is formulated in a volume that is at or about 0.5 mL, at or about 1 mL, at or about 2 mL, at or about 2.5 mL, at or about 3 mL, at or about 4 mL, at or about 5 mL, at or about 6 mL, at or about 7 mL, at or about 8 mL, at or about 9 mL or at or about 10 mL. In some embodiments, the composition is formulated in a volume that is at or about 0.5 mL, 0.6 mL, 0.7 mL, 0.8 mL, 0.9 mL, 1.0 mL, 1.2 mL, 1.4 mL, 1.6 mL, 1.8 mL or 2.0 mL, or any value between any of the foregoing.

[0367] In some embodiments, the concentration of the TACI-Fc fusion protein in the composition is from at or about 1 mg/mL to at or about 50 mg/mL, such as from at or about 1 mg/mL to at or about 25 mg/mL, from at or about 1 mg/mL to at or about 15 mg/mL, from at or about 1 mg/mL to at or about 5 mg/mL, from at or about 5 mg/mL to at or about 50 mg/mL, from at or about 5 mg/mL to at or about 25 mg/mL, from at or about 5 mg/mL to at or about 15 mg/mL, from at or about 15 mg/mL to at or about 50 mg/mL, from at or about 15 mg/mL to at or about 25 mg/mL or from at or about 25 mg/mL to at or about 50 mg/mL. In some embodiments, the concentration of the TACI-Fc fusion protein in the composition is from at or about 1 mg/mL, at or about 5 mg/mL, at or about 10 mg/mL, at or about 15 mg/mL, at or about 20 mg/mL, at or about 25 mg/mL, at or about 30 mg/mL, at or about 40 mg/mL or at or about 50 mg/mL. Provided herein are any of such compositions contained in a container such as a vial. In particular aspects, the container, such as vial, is sterile. The container may be any biocompatible container, such as a glass container. In some embodiments, the vial is a 2 mL glass vial.

[0368] In some embodiments, the concentration of the TACI-Fc fusion protein in the composition is higher than 50 mg/mL. In some embodiments, the concentration of the composition is between at or about 50 mg/mL and 200 mg/mL, such as between at or about 50 mg/mL and 150 mg/mL, between at or about 50 mg/mL and 100 mg/mL, between at or about 100 mg/mL and 200 mg/mL, between at or about 100 mg/mL and 150 mg/mL or between at or about 150 mg/mL and 200 mg/mL. In some embodiments, the concentration of the TACI-Fc fusion protein in the composition is at or about 60 mg/mL, at or about 70 mg/mL, at or about 80 mg/mL, at or about 100 mg/mL, at or about 120 mg/mL, at or about 140 mg/mL, at or about 160 mg/mL, at or about 180 mg/mL or at or about 200 mg/mL, or any value between any of the

foregoing. In some embodiments, the concentration of the TACI-Fc fusion protein in the composition is at or about 100 mg/mL. Provided herein are any of such compositions contained in a container such as a vial. In particular aspects, the container, such as vial, is sterile. The container may be any biocompatible container, such as a glass container. In some embodiments, the vial is a 2 mL glass vial.

[0369] In some embodiments, the TACI-Fc fusion protein, such as any described, is formulated in a buffered solution containing 10 mM Acetate, 3% proline, 0.015% polysorbate 80 at a pH of 5.2. In some embodiments, the TACI-Fc fusion protein is provided at 100/mg/mL as a liquid for injection (e.g. IV or SC). In some embodiments, the TACI-Fc fusion protein is provided in a volume of at or about 8 mL (e.g. 80 mg) in a container, such as in a 2 mL glass vial.

[0370] In some embodiments of the provided formulations, the TACI-Fc fusion protein is a homodimer of two polypeptide of the formula TACI-linker-Fc in which the TACI is a variant TACI that is a portion of the extracellular domain composed of the CRD2 TNF receptor domain set forth in SEQ ID NO:13 in which is present amino acid substitutions K77E, F78Y and Y102D. In some embodiments, the variant TACI is set forth in SEQ ID NO:26. In embodiments of any of the described TACI-Fc fusion proteins, the variant TACI is linked to the Fc domain via the linker. In some of any of the provided methods or uses, the TACI-Fc fusion protein has the sequence set forth in SEQ ID NO: 167. In some of any embodiments, the TACI-Fc fusion protein has the sequence set forth in SEQ ID NO: 168.

[0371] In some of any embodiments, when administering the TACI-Fc fusion protein or formulation containing the same at a concentration less than 100 mg/mL it may be diluted in a physiologically acceptable buffer, such as 0.9% sodium chloride (Normal saline).

[0372] Once the pharmaceutical composition has been formulated, it may be stored in sterile vials as a solution, suspension, gel, emulsion, solid, crystal, or as a dehydrated or lyophilized powder. Such formulations may be stored either in a ready-to-use form or in a form (e.g., lyophilized) that is reconstituted prior to administration. Also provided herein are kits for producing a single-dose administration unit. In some aspects, the kits may each contain both a first container having a dried protein and a second container having an aqueous formulation. In certain embodiments kits containing single and multi-chambered pre-filled syringes (e.g., liquid syringes and lyosyringes) are provided.

[0373] In some embodiments, the pharmaceutical composition, such as any of the provided formulations, are stable at or about -20 °C for up to 6 months or more, such as for up to 12

months or more. In some embodiments, the pharmaceutical composition is stored at or about -20 °C. In some embodiments, the storage is under conditions in which the formulation of the TACI-Fc fusion protein is protected from light.

[0374] In some embodiments, the pharmaceutical composition is administered to a subject. Generally, dosages and routes of administration of the pharmaceutical composition are determined according to the size and condition of the subject, according to standard pharmaceutical practice. For example, the therapeutically effective dose can be estimated initially either in cell culture assays or in animal models such as mice, rats, rabbits, dogs, pigs, or monkeys. An animal model may also be used to determine the appropriate concentration range and route of administration. Such information can then be used to determine useful doses and routes for administration in humans. The exact dosage will be determined in light of factors related to the subject requiring treatment. Dosage and administration are adjusted to provide sufficient levels of the active compound or to maintain the desired effect. Factors that may be taken into account include the severity of the disease state, the general health of the subject, the age, weight, and gender of the subject, time and frequency of administration, drug combination(s), reaction sensitivities, and response to therapy.

[0375] Long-acting pharmaceutical compositions may be administered every 3 to 4 days, every week, or biweekly depending on the half-life and clearance rate of the particular formulation. The frequency of dosing will depend upon the pharmacokinetic parameters of the molecule in the formulation used. Typically, a composition is administered until a dosage is reached that achieves the desired effect. The composition may therefore be administered as a single dose, or as multiple doses (at the same or different concentrations/dosages) over time, or as a continuous infusion. Further refinement of the appropriate dosage is routinely made. Appropriate dosages may be ascertained through use of appropriate dose-response data.

[0376] In some embodiments, the pharmaceutical composition is administered to a subject through any route, including orally, transdermally, by inhalation, intravenously, intra-arterially, intramuscularly, direct application to a wound site, application to a surgical site, intraperitoneally, by suppository, subcutaneously, intradermally, transcutaneously, by nebulization, intrapleurally, intraventricularly, intra-articularly, intraocularly, or intraspinally.

[0377] In some embodiments, a provided pharmaceutical formulation may, for example, be in a form suitable for intravenous infusion. In some embodiments, a provided formulation may be in a form suitable for subcutaneous administration.

V. METHODS FOR ASSESSING ACTIVITY AND IMMUNE MODULATION OF IMMUNOMODULATORY PROTEINS

[0378] In some embodiments, the provided immunomodulatory proteins, such as TACI fusion proteins provided herein exhibit immunomodulatory activity. The provided immunomodulatory proteins, such as TACI fusion protein can modulate B cell activity, such as one or more of B cell proliferation, differentiation or survival.

[0379] The function of immunomodulatory proteins can be examined using a variety of approaches to assess the ability of the proteins to bind to cognate binding partners. For example, TACI fusion proteins may be assessed for binding to APRIL or BAFF. A variety of assays are known for assessing binding affinity and/or determining whether a binding molecule (*e.g.*, immunomodulatory protein) specifically binds to a particular binding partner. It is within the level of a skilled artisan to determine the binding affinity of a binding molecule, *e.g.*, immunomodulatory protein, for a binding partner, *e.g.*, APRIL or BAFF, such as by using any of a number of binding assays that are well known in the art. Various binding assays are known and include, but are not limited to, for example, ELISA K_D , KinExA, flow cytometry, and/or surface plasmon resonance devices), including those described herein. Such methods include, but are not limited to, methods involving BIAcore®, Octet®, or flow cytometry. For example, in some embodiments, a BIAcore® instrument can be used to determine the binding kinetics and constants of a complex between two proteins using surface plasmon resonance (SPR) analysis (*see, e.g.*, Scatchard *et al.*, *Ann. N.Y. Acad. Sci.* 51:660, 1949; Wilson, *Science* 295:2103, 2002; Wolff *et al.*, *Cancer Res.* 53:2560, 1993; and U.S. Patent Nos. 5,283,173, 5,468,614, or the equivalent). SPR measures changes in the concentration of molecules at a sensor surface as molecules bind to or dissociate from the surface. The change in the SPR signal is directly proportional to the change in mass concentration close to the surface, thereby allowing measurement of binding kinetics between two molecules. The dissociation constant for the complex can be determined by monitoring changes in the refractive index with respect to time as buffer is passed over the chip. Other suitable assays for measuring the binding of one protein to another include, for example, immunoassays such as enzyme linked immunosorbent assays (ELISA) and radioimmunoassays (RIA), or determination of binding by monitoring the change in the spectroscopic or optical properties of the proteins through fluorescence, UV absorption, circular dichroism, or nuclear magnetic resonance (NMR). Other exemplary assays include, but are not limited to, Western blot, ELISA, analytical ultracentrifugation, spectroscopy, flow cytometry, sequencing and other methods for detection of expressed polynucleotides or binding of proteins.

[0380] Provided immunomodulatory proteins also can be assessed in any of a variety of assays to assess modulation of B cell activity. One such assay is a cell proliferation assay. Cells are cultured in the presence or absence of a test compound (e.g. immunomodulatory protein), and cell proliferation is detected by, for example, measuring incorporation of tritiated thymidine or by colorimetric assay based on the metabolic breakdown of 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide (MTT) (Mosman, J. Immunol. Meth. 65: 55-63, 1983). An alternative assay format uses cells that are further engineered to express a reporter gene. The reporter gene is linked to a promoter element that is responsive to the receptor-linked pathway, and the assay detects activation of transcription of the reporter gene. Numerous reporter genes that are easily assayed for in cell extracts are known in the art, for example, the *E. coli* lacZ, chloroamphenicol acetyl transferase (CAT) and serum response element (SRE) (see, e.g., Shaw et al., Cell 56:563-72, 1989). An exemplary reporter gene is a luciferase gene (de Wet et al., Mol. Cell. Biol. 7:725, 1987). Expression of the luciferase gene is detected by luminescence using methods known in the art (e.g., Baumgartner et al., J. Biol. Chem. 269:29094-101, 1994; Schenborn and Goiffin, Promega Notes 41:11, 1993). Luciferase activity assay kits are commercially available from, for example, Promega Corp., Madison, Wis.

[0381] Provided immunomodulatory proteins can be characterized by the ability to inhibit the stimulation of human B cells by soluble APRIL or BAFF, as described by Gross et al., international publication No. WO00/40716. Briefly, human B cells are isolated from peripheral blood mononuclear cells, such as using CD19 magnetic beads separation (e.g. Miltenyi Biotec Auburn, CA). The purified B cells can be incubated under conditions of stimulation, e.g. in the presence of soluble APRIL, and further in the presence of titrated concentration of immunomodulatory protein. The B cells can be labeled with a proliferation dye or can be labeled with 1 μ Ci ^{3} H-thymidine to measure proliferation. The number of B cells can be determined over time.

[0382] Reporter cell lines that express a reporter gene under the operable control of a transcription factor, such as NF- κ B, NFAT-1 and AP-1, can be made that express TACI or BCMA. For example, the reporter cell can include Jurkat and other B Lymphoma cell lines. Incubation of these cells with soluble BAFF or APRIL ligands signal through the reporter genes in these constructs. The effect of provided immunomodulatory proteins to modulate this signaling can be assessed.

[0383] Well established animal models are available to test in vivo efficacy of provided immunomodulatory proteins in certain disease states, including those involving autoimmune or

inflammatory conditions. For example, animal models of autoimmune disease include, for example, MRL-lpr/lpr or NZB×NZW F1 congenic mouse strains which serve as a model of SLE (systemic lupus erythematosus). Such animal models are known in the art, see for example *Autoimmune Disease Models A Guidebook*, Cohen and Miller eds. Academic Press. Offspring of a cross between New Zealand Black (NZB) and New Zealand White (NZW) mice develop a spontaneous form of SLE that closely resembles SLE in humans. The offspring mice, known as NZBW begin to develop IgM autoantibodies against T-cells at 1 month of age, and by 5-7 months of age, Ig anti-DNA autoantibodies are the dominant immunoglobulin. Polyclonal B-cell hyperactivity leads to overproduction of autoantibodies. The deposition of these autoantibodies, particularly ones directed against single stranded DNA is associated with the development of glomerulonephritis, which manifests clinically as proteinuria, azotemia, and death from renal failure. Kidney failure is the leading cause of death in mice affected with spontaneous SLE, and in the NZBW strain, this process is chronic and obliterative. The disease is more rapid and severe in females than males, with mean survival of only 245 days as compared to 406 days for the males. While many of the female mice will be symptomatic (proteinuria) by 7-9 months of age, some can be much younger or older when they develop symptoms. The fatal immune nephritis seen in the NZBW mice is very similar to the glomerulonephritis seen in human SLE, making this spontaneous murine model very attractive for testing of potential SLE therapeutics (Putterman and Naparstek, *Murine Models of Spontaneous Systemic Lupus Erythematosus*, *Autoimmune Disease Models: A Guidebook*, chapter 14, pp. 217-34, 1994; Mohan et al., *J. Immunol.* 154:1470-80, 1995; and Daikh et al., *J. Immunol.* 159:3104-08, 1997). Administration of provided immunomodulatory proteins to these mice to evaluate the efficacy to ameliorate symptoms and alterations to the course of disease can be assessed.

[0384] Another mouse model of inflammation and lupus-like disease is the bm12 inducible mouse model of SLE (Klarquist and Janssen, 2015. *J. Vis. Exp.* (105), e53319). Splenocyte suspensions from female I-A^{bm12}B6(C)-H2-Ab1^{bm12}/KhEgJ ('bm12') mice are adoptively transferred into female C57BL/6NJ recipient mice. H2-Ab1^{bm12} differs from H2-Ab1^b by 3 nucleotides, resulting in alteration of 3 amino acids in the β-chain of the MHC class II I-A molecule. Alloactivation of donor bm12 CD4⁺ T cells by recipient antigen presenting cells leads to chronic GVHD with symptoms closely resembling SLE, including autoantibody production, changes in immune cell subsets, and mild kidney disease. Glomerulonephritis with immune complex deposition develops late in the model, largely comprised of autoantigens bound to

IgG1, IgG2b, IgG2c, and IgG3 antibodies. Endpoints of this model may include concentrations of anti-dsDNA antibodies, select IgG isotypes, blood urea nitrogen (BUN), and creatinine in serum, immune cell subset composition in the spleen and cervical LN, and kidney histology.

[0385] In some embodiments, mouse models for Sjögren's syndrome (SjS) can be used. The SjS disease, as well as an accelerated onset of diabetes, can be induced in female diabetes-prone non-obese diabetic (NOD) mice using repeat dosing with anti-mouse (m) PD-L1 antibody, based on a modified version of a protocol published by Zhou et al., 2016 Sci. Rep. 6, 39105. Starting at 6 weeks of age, mice are injected intraperitoneally (IP) on Study Days 0, 2, 4, and 6 with 100 µg of anti-PD-L1 antibody and are treated on various days with provided immunomodulatory proteins. Naïve mice are included as controls for the endpoint analyses. All mice are typically terminated on Study Day 10 and submandibular glands (SMG) and the pancreas from each mouse are collected for histopathology evaluation to assess for signs and severity of sialadenitis and insulinitis. Blood glucose levels can be measured on various days.

[0386] In some embodiments, mouse models for experimental allergic encephalomyelitis (EAE) can be used. The models resemble human multiple sclerosis, and produces demyelination as a result of T-cell activation to neuroproteins such as myelin basic protein (MBP), or proteolipid protein (PLP). Inoculation with antigen leads to induction of CD4+, class II MHC-restricted T-cells (Th1). Changes in the protocol for EAE can produce acute, chronic-relapsing, or passive-transfer variants of the model (Weinberg et al., *J. Immunol.* 162:1818-26, 1999; Mijaba et al., *Cell. Immunol.* 186:94-102, 1999; and Glabinski, *Meth. Enzym.* 288:182-90, 1997). Administration of provided immunomodulatory proteins to ameliorate symptoms and alterations to the course of disease can be assessed.

[0387] In some embodiments, a collagen-induced arthritis (CIA) model can be used in which mice develop chronic inflammatory arthritis which closely resembles human rheumatoid arthritis (RA). Since CIA shares similar immunological and pathological features with RA, this makes it an ideal model for screening potential human anti-inflammatory compounds. Another advantage in using the CIA model is that the mechanisms of pathogenesis are known. The T and B cell epitopes on type II collagen have been identified, and various immunological (delayed-type hypersensitivity and anti-collagen antibody) and inflammatory (cytokines, chemokines, and matrix-degrading enzymes) parameters relating to immune-mediating arthritis have been determined and can be used to assess test compound efficacy in the models (Wooley, *Curr. Opin. Rheum.* 3:407-20, 1999; Williams et al., *Immunol.* 89:9784-788, 1992; Myers et al., *Life Sci.* 61:1861-78, 1997; and Wang et al., *Immunol.* 92:8955-959, 1995). Administration of

provided immunomodulatory proteins to ameliorate symptoms and alterations to the course of disease can be assessed.

[0388] In some embodiments, models for bronchial infection, such as asthma, can be created when mice are injected with ovalbumin and restimulated nasally with antigen which produces an asthmatic response in the bronchi similar to asthma. Administration of provided immunomodulatory proteins to ameliorate symptoms and alterations to the course of disease can be assessed.

[0389] In some embodiments, myasthenia gravis (MG) is another autoimmune disease for which murine models are available. MG is a disorder of neuromuscular transmission involving the production of autoantibodies directed against the nicotinic acetylcholine receptor (AChR). MG is acquired or inherited with clinical features including abnormal weakness and fatigue on exertion. A mouse model of MG has been established. (Christadoss et al., *Establishment of a Mouse Model of Myasthenia Gravis Which Mimics Human Myasthenia Gravis Pathogenesis for Immune Intervention*, in *Immunobiology of Proteins and Peptides VIII*, Atassi and Bixler, eds., 1995, pp. 195-99.) Experimental autoimmune myasthenia gravis (EAMG) is an antibody mediated disease characterized by the presence of antibodies to AChR. These antibodies destroy the receptor leading to defective neuromuscular electrical impulses, resulting in muscle weakness. In the EAMG model, mice are immunized with the nicotinic acetylcholine receptor. Clinical signs of MG become evident weeks after the second immunization. EAMG is evaluated by several methods including measuring serum levels of AChR antibodies by radioimmunoassay (Christadoss and Dauphinee, *J. Immunol.* 136:2437-40, 1986; and Lindstrom et al., *Methods Enzymol.* 74:432-60, 1981), measuring muscle AChR, or electromyography (Wu et al. *Protocols in Immunology*. Vol. 3, Eds. Coligen, Kruisbeak, Margulies, Shevach, and Strober. John Wiley and Sons, New York, p. 15.8.1, 1997).

[0390] Another use for in vivo models includes delivery of an antigen challenge to the animal followed by administration of immunomodulatory proteins and measuring the T and B cell response. T cell dependent and T cell independent immune response can be measured as described in Perez-Melgosa et al., *J. Immunol.* 163:1123-7, 1999. Immune response in animals subjected to a regular antigen challenge (for example, keyhole limpet hemacyanin (KLH), sheep red blood cells (SRBC), ovalbumin or collagen) followed by administration of provided immunomodulatory proteins can be done to measure effect on B cell response.

[0391] Pharmacokinetic studies can be used in association with radiolabeled immunomodulatory proteins to determine the distribution and half life of such polypeptides in vivo.

[0392] In some embodiments, modeling and simulation of pharmacokinetic (PK) and pharmacodynamic (PD) profiles observed in control animals and animal models of disease (e.g., cancer models) can be used to predict or determine patient dosing. For example, PK data from non-human primates (e.g., cynomolgus monkeys) can be used to estimate human PK. Similarly, mouse PK and PD data can be used to predict human dosing. The observed animal data can be used to inform computational models which can be used to simulate human dose response.

VI. THERAPEUTIC APPLICATIONS

[0393] The pharmaceutical compositions described herein (including pharmaceutical composition comprising the immunomodulatory protein, e.g. TACI-Fc, described herein) can be used in a variety of therapeutic applications, such as in methods for the treatment of a disease. The therapeutic applications of the pharmaceutical compositions include methods and uses of any of the provided formulations. For example, in some embodiments the pharmaceutical composition, such as any provided formulation, is used to treat inflammatory or autoimmune disorders, cancer, organ transplantation, viral infections, and/or bacterial infections in a mammal. The pharmaceutical composition, such as any provided formulation, can modulate (e.g. decrease) an immune response to treat the disease.

[0394] Such methods and uses include therapeutic methods and uses, for example, involving administration of the molecules or compositions containing the same, to a subject having a disease, condition, or disorder. In some cases, such as described, the disease, condition or disorder is an autoimmune or inflammatory disease or disorder. In some embodiments, the molecule or engineered cell is administered in an effective amount to effect treatment of the disease or disorder. Uses include uses of molecules containing an immunomodulatory protein, and in the preparation of a medicament in order to carry out such therapeutic methods. In some embodiments, the methods are carried out by administering a provided immunomodulatory protein, or compositions comprising the same, to the subject having or suspected of having the disease or condition. In some embodiments, the methods thereby treat the disease, disorder or condition or disorder in the subject.

[0395] Illustrative subjects include mammalian subjects, such as farm animals, domestic animals, and human patients. In particular embodiments, the subject is a human subject.

[0396] The pharmaceutical compositions described herein can be used in a variety of therapeutic applications, such as the treatment of a disease. For example, in some embodiments the pharmaceutical composition is used to treat inflammatory or autoimmune disorders, organ transplantation, viral infections, and/or bacterial infections in a mammal. The pharmaceutical composition can modulate an immune response to treat the disease. In some embodiments, the pharmaceutical composition suppresses an immune response, which can be useful in the treatment of inflammatory or autoimmune disorders, or organ transplantation.

[0397] The provided methods are believed to have utility in a variety of applications, including, but not limited to, e.g., in prophylactic or therapeutic methods for treating a variety of immune system diseases or conditions in a mammal in which modulation or regulation of the immune system and immune system responses is beneficial. For example, suppressing an immune response can be beneficial in prophylactic and/or therapeutic methods for inhibiting rejection of a tissue, cell, or organ transplant from a donor by a recipient. In a therapeutic context, the mammalian subject is typically one with an immune system disease or condition, and administration is conducted to prevent further progression of the disease or condition.

[0398] The provided immunomodulatory proteins, including TACI fusion proteins, can be used for the treatment of autoimmune diseases, B cell cancers, immunomodulation, EBD and any antibody-mediated pathologies (e.g., ITCP, myasthenia gravis and the like), renal diseases, indirect T cell immune response, graft rejection, and graft versus host disease. Administration of the immunomodulatory proteins (e.g. TACI-Fc) can specifically regulate B cell responses during the immune response. Additionally, administration of provided immunomodulatory proteins can be used to modulate B cell development, development of other cells, antibody production, and cytokine production. Administration or use of provided immunomodulatory proteins can also modulate B cell communication, such as by neutralizing the proliferative effects of BAFF or APRIL.

[0399] In some embodiments, the pharmaceutical composition suppresses an immune response, which can be useful in the treatment of inflammatory or autoimmune disorders, or organ transplantation. In some embodiments, the pharmaceutical composition contains an immunomodulatory protein that exhibits antagonist activity of a B cell stimulatory receptor, thereby decreasing or reducing an immune response. In some embodiments, the compositions can be used to treat a B cell-mediated disease.

[0400] In some embodiments, the compositions can be used to treat an autoimmune disease. In some embodiments, the administration of a therapeutic composition containing an

immunomodulatory protein provided herein to a subject suffering from an immune system disease (e.g., autoimmune disease) can result in suppression or inhibition of such immune system attack or biological responses associated therewith. By suppressing this immune system attack on healthy body tissues, the resulting physical symptoms (e.g., pain, joint inflammation, joint swelling or tenderness) resulting from or associated with such attack on healthy tissues can be decreased or alleviated, and the biological and physical damage resulting from or associated with the immune system attack can be decreased, retarded, or stopped. In a prophylactic context, the subject may be one with, susceptible to, or believed to present an immune system disease, disorder or condition, and administration is typically conducted to prevent progression of the disease, disorder or condition, inhibit or alleviate symptoms, signs, or biological responses associated therewith, prevent bodily damage potentially resulting therefrom, and/or maintain or improve the subject's physical functioning.

[0401] In some embodiments, the disease or conditions that can be treated by the pharmaceutical composition described herein is any disease mediated by immune complex deposition (e.g. lupus nephritis, vasculitis); direct interference with a pathway (e.g. catastrophic antiphospholipid antibody syndrome, myasthenia gravis crisis; anti-Jo-1 disease); opsonization or direct damage to cells (e.g. Idiopathic thrombocytopenic purpura, autoimmune hemolytic anemia); antibody-mediated rejection of an allograft (e.g. highly-sensitized renal transplant patients); or anti-drug antibodies to biologic replacement factors, vectors (e.g. anti-Factor 8).

[0402] In some embodiments, the inflammatory or autoimmune disorders, conditions or diseases that can be treated by the pharmaceutical composition described herein is Systemic lupus erythematosus (SLE), including flare prevention without glucocorticoids; Sjögren's syndrome; Primary biliary cirrhosis (PBC); Systemic scleroderma; Polymyositis; Diabetes prevention; IgA nephropathy; IgA vasculitis; B cell cancers, for example myeloma; Multiple sclerosis, Optic neuritis.

[0403] In some embodiments, the inflammatory or autoimmune disorder is an inflammatory arthritis. Examples of inflammatory arthritis for treatment in accord with the provided methods include, but are not limited to rheumatoid arthritis, psoriatic arthritis, lupus, lyme disease, gout, or ankylosing spondylitis.

[0404] In some embodiments, the provided immunomodulatory proteins can be used to treat pre-B or B-cell leukemias, such as plasma cell leukemia, chronic or acute lymphocytic leukemia, myelomas such as multiple myeloma, plasma cell myeloma, endothelial myeloma and giant cell myeloma, and lymphomas such as non-Hodgkins lymphoma. In some of any

embodiments, the type of myeloma includes multiple myeloma, plasmacytoma, multiple solitary plasmacytoma, and/or extramedullary myeloma. In some of any embodiments, the type of myeloma includes light chain myeloma, nonsecretory myeloma, and/or IgD or IgE myeloma.

[0405] In some embodiments, the provided immunomodulatory proteins can be used as immunosuppressants to selectively block the action of B-lymphocytes for use in treating disease. For example, certain autoimmune diseases are characterized by production of autoantibodies, which contribute to tissue destruction and exacerbation of disease. Autoantibodies can also lead to the occurrence of immune complex deposition complications and lead to many symptoms of systemic lupus erythematosus, including kidney failure, neuralgic symptoms and death. Modulating antibody production independent of cellular response would also be beneficial in many disease states. B cells have also been shown to play a role in the secretion of arthritogenic immunoglobulins in rheumatoid arthritis. Methods and uses of the provided immunomodulatory proteins to inhibit, block or neutralize action of B cells to thereby suppress antibody production would be beneficial in treatment of autoimmune diseases such as myasthenia gravis, rheumatoid arthritis, polyarticular-course juvenile rheumatoid arthritis, and psoriatic arthritis.

[0406] In some embodiments, the provided immunomodulatory proteins can be used to block or neutralize the actions of B-cells in association with end stage renal diseases, which may or may not be associated with autoimmune diseases. Such methods would also be useful for treating immunologic renal diseases. Such methods would be useful for treating glomerulonephritis associated with diseases such as membranous nephropathy, IgA nephropathy or Berger's Disease, IgM nephropathy, IgA Vasculitis, Goodpasture's Disease, post-infectious glomerulonephritis, mesangioproliferative disease, chronic lymphoid leukemia, minimal-change nephrotic syndrome. Such methods would also serve as therapeutic applications for treating secondary glomerulonephritis or vasculitis associated with such diseases as lupus, polyarteritis, Henoch-Schonlein, Scleroderma, HTV-related diseases, amyloidosis or hemolytic uremic syndrome. The provided methods would also be useful as part of a therapeutic application for treating interstitial nephritis or pyelonephritis associated with chronic pyelonephritis, analgesic abuse, nephrocalcinosis, nephropathy caused by other agents, nephrolithiasis, or chronic or acute interstitial nephritis. The methods provided herein also include use of the provided immunomodulatory proteins in the treatment of hypertensive or large vessel diseases, including renal artery stenosis or occlusion and cholesterol emboli or renal emboli. The provided methods and uses also can be used for treatment of renal or urological neoplasms, multiple myelomas, lymphomas, light chain neuropathy or amyloidosis.

[0407] In some embodiments, the provided immunomodulatory proteins also can be used for the treatment of asthma and other chronic airway diseases such as bronchitis and emphysema. The provided immunomodulatory proteins can also be used to treat Sjogren's Syndrome.

[0408] In some embodiments, methods and uses of the provided immunomodulatory proteins include immunosuppression, in particular for such therapeutic use as for graft-versus-host disease and graft rejection. In some embodiments, methods and uses of the provided immunomodulatory proteins include treatment of such autoimmune diseases as insulin dependent diabetes mellitus (IDDM) and Crohn's Disease. Methods provided herein would have additional therapeutic value for treating chronic inflammatory diseases, in particular to lessen joint pain, swelling, anemia and other associated symptoms as well as treating septic shock.

[0409] In some embodiments, the inflammatory and autoimmune disorders that can be treated by a pharmaceutical composition containing an immunomodulatory protein described herein include, but are not limited to, Achalasia; Addison's disease; Adult Still's disease; Agammaglobulinemia; Alopecia areata; Amyloidosis; Ankylosing spondylitis; Anti-GBM/Anti-TBM nephritis; Antiphospholipid syndrome; Autoimmune adrenalitis (Addison's disease); Autoimmune angioedema; Autoimmune dysautonomia; Autoimmune encephalomyelitis; Autoimmune hepatitis; Autoimmune inner ear disease (AIED); Autoimmune myocarditis; Autoimmune oophoritis; Autoimmune orchitis; Autoimmune pancreatitis; Autoimmune polyglandular syndrome type II (APS II); Autoimmune retinopathy; Autoimmune thyroid disease (AITD), i.e. Hashimoto's disease; Autoimmune urticarial; Axonal & neuronal neuropathy (AMAN); Baló disease; Behcet's disease; Benign mucosal pemphigoid; Bullous pemphigoid; Castleman disease (CD); Celiac disease; Chagas disease; Chronic inflammatory demyelinating polyneuropathy (CIDP); Chronic recurrent multifocal osteomyelitis (CRMO); Churg-Strauss Syndrome (CSS) or Eosinophilic Granulomatosis (EGPA); Cicatricial pemphigoid; Cogan's syndrome; Cold agglutinin disease; Congenital heart block; Coxsackie myocarditis; CREST syndrome; Crohn's disease; Dermatitis herpetiformis; Dermatomyositis; Devic's disease (neuromyelitis optica); Discoid lupus; Dressler's syndrome; Endometriosis; Eosinophilic esophagitis (EoE); Eosinophilic fasciitis; Erythema nodosum; Essential mixed cryoglobulinemia; Evans syndrome; Fibromyalgia; Fibrosing alveolitis; Giant cell arteritis (temporal arteritis); Giant cell myocarditis; Glomerulonephritis; Goodpasture's syndrome; Granulomatosis with Polyangiitis; Graves' disease; Guillain-Barre syndrome; Hashimoto's thyroiditis; Hemolytic anemia; Henoch-Schonlein purpura (HSP); Herpes gestationis or pemphigoid gestationis (PG); Hidradenitis Suppurativa (HS) (Acne Inversa);

Hypogammaglobulinemia; IgA Nephropathy; IgA Vasculitis; IgG4-related sclerosing disease; Immune thrombocytopenic purpura (ITP); Inclusion body myositis (IBM); Interstitial cystitis (IC); Juvenile arthritis; Juvenile diabetes (Type 1 diabetes); Juvenile myositis (JM); Kawasaki disease; Lambert-Eaton syndrome; Leukocytoclastic vasculitis; Lichen planus; Lichen sclerosus; Ligneous conjunctivitis; Linear IgA disease (LAD); Lupus; Lyme disease chronic; Meniere's disease; Microscopic polyangiitis (MPA); Mixed connective tissue disease (MCTD); Mooren's ulcer; Mucha-Habermann disease; Multifocal Motor Neuropathy (MMN) or MMNCB; Multiple sclerosis; Myasthenia gravis; Myositis; Narcolepsy; Neonatal Lupus; Neuromyelitis optica; Neutropenia; Ocular cicatricial pemphigoid; Optic neuritis; Palindromic rheumatism (PR); PANDAS; Paraneoplastic cerebellar degeneration (PCD); Paroxysmal nocturnal hemoglobinuria (PNH); Parry Romberg syndrome; Pars planitis (peripheral uveitis); Parsonage-Turner syndrome; Pemphigus, Pemphigus vulgaris; Peripheral neuropathy; Perivenous encephalomyelitis; Pernicious anemia (PA); POEMS syndrome; Polyarteritis nodosa; Polyglandular syndromes type I, II, III; Polymyalgia rheumatic; Polymyositis; Postmyocardial infarction syndrome; Postpericardiotomy syndrome; Primary biliary cirrhosis; Primary sclerosing cholangitis; Progesterone dermatitis; Psoriasis; Psoriatic arthritis; Pure red cell aplasia (PRCA); Pyoderma gangrenosum; Raynaud's phenomenon; Reactive Arthritis; Reflex sympathetic dystrophy; Relapsing polychondritis; Restless legs syndrome (RLS); Retroperitoneal fibrosis; Rheumatic fever; Rheumatoid arthritis; Sarcoidosis; Schmidt syndrome; Scleritis; Scleroderma; Sjögren's syndrome; Sperm & testicular autoimmunity; Stiff person syndrome (SPS); Subacute bacterial endocarditis (SBE); Susac's syndrome; Sympathetic ophthalmia (SO); systemic lupus erythematosus (SLE); Takayasu's arteritis; Temporal arteritis/Giant cell arteritis; Thrombocytopenic purpura (TTP); Tolosa-Hunt syndrome (THS); Transverse myelitis; Type 1 diabetes; Ulcerative colitis (UC); Undifferentiated connective tissue disease (UCTD); Uveitis; Vasculitis; Vitiligo or Vogt-Koyanagi-Harada Disease. In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat Scleroderma, Myasthenia gravis, GVHD (including acute GVHD or chronic GVHD), an immune response in connection with transplantation; Antiphospholipid Ab syndrome; Multiple sclerosis; Sjogren's syndrome; IgG4-related disease; Type I diabetes; Rheumatoid arthritis including glucocorticoid therapy (GC) RA or Acute lupus nephritis.

[0410] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat Amyotrophic lateral sclerosis, Neuromyelitis optica, Transverse myelitis, CNS autoimmunity, Guillain-barre syndrome, Neurocystercosis, Sarcoidosis (T/seroneg), Churg-

Strauss Syndrome, Hashimoto's thyroiditis, Grave's disease, immune thrombocytopenia (ITP), Addison's Disease, Polymyositis, or Dermatomyositis.

[0411] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat IgA nephropathy, chronic inflammatory demyelinating polyneuropathy (CIDP), antisynthetase disease such as Jo-1 syndrome, or ANCA vasculitis.

[0412] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat an autoantibody-associated glomerular disease. In some embodiments, the autoantibody-associated glomerular disease may include immunoglobulin (Ig) A nephropathy (IgAN), lupus nephritis (LN), primary membranous nephropathy (pMN), or renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV).

[0413] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat immunoglobulin (Ig) A nephropathy (IgAN). In some embodiments, the IgAN diagnosis has been confirmed by biopsy within less than or equal to 3 years prior to screening or selection for administration, or initiation of administration, of the TACI-Fc fusion protein treatment. In some embodiments, a biopsy may be carried out on the subject prior to administration of the TACI-Fc fusion protein. In some embodiments, the subject is one that has elevated galactose deficient IgA1 (GdIgA1) antibodies at the time of, or when selected for, administration with the TACI-Fc fusion protein.

[0414] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat lupus nephritis (LN). In some embodiments, the LN diagnosis has been confirmed by biopsy within less than or equal to 1 year prior to the initiation of screening for administration, or initiation of administration, of the TACI-Fc fusion protein treatment. In some embodiments, the subject is one that has a renal biopsy that shows evidence of active, proliferative Class III or IV LN per ISN/RPS criteria (see e.g. Markowitz and D'Agati, 2007, *Kidney Int.* 71:491-5). In some embodiments, the subject may co-exhibit Class V disease in addition to either Class III or Class IV disease. In some embodiments, a biopsy may be carried out on the subject prior to administration of the TACI-Fc fusion protein. In some embodiments, the subject has elevated anti-double stranded DNA (anti-dsDNA) at the time of, or when selected for, administration with the TACI-Fc fusion protein. In some embodiments, the subject is positive for anti-nuclear antibody (ANA) at the time of, or when selected for, administration with the TACI-Fc fusion protein. In some embodiments, the subject that is positive for ANA has a titer of greater than or equal to 1:80.

[0415] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat primary membranous nephropathy (pMN). In some embodiments, the pMN diagnosis has been confirmed by biopsy within less than or equal to 3 years prior to screening or selection for administration, or initiation of administration, of the TACI-Fc fusion protein treatment. In some embodiments, a biopsy may be carried out on the subject prior to administration of the TACI-Fc fusion protein. In some embodiments, the subject is positive for anti-phospholipase A2 receptor 1 (anti-PLA2R1) antibodies and/or anti-thrombospondin type-1 domain-containing 7A (anti-THSD7A) antibodies at the time of, or when selected for, administration with the TACI-Fc fusion protein.

[0416] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV). In some embodiments, the renal AAV diagnosis has been confirmed by biopsy within less than or equal to 23 years prior to screening or selection for administration, or initiation of administration, of the TACI-Fc fusion protein treatment. In some embodiments, the biopsy confirms evidence of renal ANCA-associated vasculitis. In some embodiments, a biopsy may be carried out on the subject prior to administration of the TACI-Fc fusion protein. In some embodiments the subject is positive for anti-proteinase 3 (PR3) or anti-myeloperoxidase (MPO) antibodies at the time of, or when selected for administration with the TACI-Fc fusion protein.

[0417] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat systemic lupus erythematosus (SLE).

[0418] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat Sjogren's syndrome (SjS).

[0419] In some embodiments, the provided immunomodulatory proteins (e.g. TACI-Fc) can be used to treat a B cell cancer. In some embodiments, the B cell cancer is a cancer in which BAFF and APRIL are involved or implicated in providing an autocrine survival loop to the B cells. In some embodiments, the cancer is B cell chronic lymphocytic leukemia, non-Hodgkins' lymphoma or myeloma. In some embodiments, the cancer is myeloma. In some of any embodiments, the type of myeloma includes multiple myeloma, plasmacytoma, multiple solitary plasmacytoma, and/or extramedullary myeloma. In some of any emodiments, the type of myeloma includes light chain myeloma, nonsecretory myeloma, and/or IgD or IgE myeloma.

[0420] In some embodiments, the subject may receive standard of care (SOC) therapy for their underlying disorder, which is within the level of skill of the investigator or clinical physician. In some embodiments, the SOC therapy may include a renin-angiotensin-aldosterone

system inhibitor (RAASi), a statin, a diuretic, an immune modulator, an immunosuppressant or a corticosteroid. In some embodiments, the subject has previously received the SOC therapy prior to receiving the provided TACI-Fc fusion protein. In some embodiments, the subject continues receiving the SOC therapy while receiving administration of the provided TACI-Fc fusion protein. In some embodiments, the SOC therapy is tapered over time after receiving administration of the provided TACI-Fc fusion protein. In some embodiments, the SOC therapy may include an antimalarial, an antibiotic such as a tetracycline, a steroid such as prednisone, a sodium-glucose cotransporter-2 (SGLT2) inhibitors, mycophenolate mofetil (MMF), mycophenolic acid (MPA), voclosporin or other SOC therapy within the level of a skilled artisan. In some embodiments, just prior to the initiation of administration of the TACI-Fc the subject has not received, or is not receiving, combination therapy with two immunomodulatory treatments, such as MMF and voclosporin.

[0421] In some embodiments, the subject has LN or renal AAV and the subject has received therapy with mycophenolate mofetil (MMF)/mycophenolic acid (MPA) or other immunotherapy as a standard of care therapy for treating the LN or renal AAV. In some embodiments, the subject is administered mycophenolate mofetil (MMF)/mycophenolic acid (MPA) or other immunotherapy as a standard of care therapy for treating the LN or renal AAV, prior to or during the administration of the provided TACI-Fc fusion protein. In some embodiments, the subject has not received a steroid within 5 days prior to the initiation of administration of the provided TACI-Fc fusion protein.

[0422] In some embodiments, the subject that is administered a provided immunomodulatory proteins (e.g. TACI-Fc) in accord with the provided methods does not have another renal disease including but not limited to diabetic nephropathy; C3 glomerulonephropathy; focal segmental glomerulosclerosis; thin basement membrane disease; Alport's disease; IgA vasculitis; minimal change disease; post-infectious glomerulonephritis; secondary membranous nephropathy (excluding LN Class V combined with Class III or IV); or secondary IgAN including but not limited to Celiac disease, Crohn's disease, HIV, or liver cirrhosis.

[0423] In some embodiments, the subject has not received an agent that directly depletes B lymphocytes (e.g. Rituximab) within 48 weeks prior to initiation of administration of the provided immunomodulatory proteins (e.g. TACI-Fc). In some embodiments, the subject may have received an agent that directly depletes B lymphocytes (e.g. Rituximab) within greater than 24 weeks prior to initiation of administration of the provided immunomodulatory proteins (e.g.

TACI-Fc) if B cells have returned to normal reference ranges prior to administration of the TACI-Fc fusion protein.

[0424] In some embodiments, the subject has not received an agent that directly inhibits BAFF and/or APRIL, such as Belimumab, within 24 weeks prior to initiation of administration of the provided immunomodulatory proteins (e.g. TACI-Fc).

[0425] In some embodiments, the subject has not received administration of Intravenous Ig, abatacept, anifrolumab, belatacept, adalimumab, infliximab, certolizumab, etanercept, golimumab, anakinra, canakinumab, tocilizumab, sarilumab, satralizumab within 8 weeks prior to initiation of administration of the provided immunomodulatory proteins (e.g. TACI-Fc). In some embodiments, the subject has not received administration of any approved therapeutic agent for treating an immune disease within 8 weeks prior to initiation of administration of the provided immunomodulatory proteins (e.g. TACI-Fc).

[0426] In some embodiments, the subject has not received cyclophosphamide within 8 weeks prior to initiation of administration of the provided immunomodulatory proteins (e.g. TACI-Fc).

[0427] In some embodiments, a therapeutic amount of the pharmaceutical composition is administered. Typically, precise amount of the compositions of the present invention to be administered can be determined by a physician with consideration of individual differences in age, weight, extent of infection, and condition of the patient (subject). The optimal dosage and treatment regime for a particular patient can readily be determined by one skilled in the art of medicine by monitoring the patient for signs of disease and adjusting the treatment accordingly.

[0428] In some embodiments, the subject is human. In some embodiments, the subject is an adult subject. In some embodiments, the subject is greater than or equal to 18 years of age.

[0429] In some embodiments, a pharmaceutical composition described herein (including a pharmaceutical composition comprising any of the TACI-Fc fusion proteins described herein) is administered to a subject. Generally, dosages and routes of administration of the pharmaceutical composition are determined according to the size and condition of the subject, according to standard pharmaceutical practice. For example, the therapeutically effective dose can be estimated initially either in cell culture assays or in animal models such as mice, rats, rabbits, dogs, pigs, or monkeys. An animal model may also be used to determine the appropriate concentration range and route of administration. Such information can then be used to determine useful doses and routes for administration in humans. The exact dosage can be determined in light of factors related to the subject requiring treatment. Dosage and administration can be

adjusted to provide sufficient levels of the active compound or to maintain the desired effect. Factors that may be taken into account include the severity of the disease state, the general health of the subject, the age, weight, and gender of the subject, time and frequency of administration, drug combination(s), reaction sensitivities, and response to therapy.

[0430] In some embodiments, modeling and simulation of pharmacokinetic (PK) and pharmacodynamic (PD) profiles observed in control animals and animal models of disease (e.g., cancer models) can be used to predict or determine patient dosing. For example, PK data from non-human primates (e.g., cynomolgus monkeys) can be used to estimate human PK. Similarly, mouse or rat PK and PD data can be used to predict human dosing. The observed animal data can be used to inform computational models which can be used to simulate human dose response.

[0431] In some embodiments, methods provided herein include administering a pharmaceutical composition described herein (including pharmaceutical composition comprising a TACI-Fc fusion proteins) in an amount in which a dose is known or predicted to neutralize an activity of APRIL or BAFF ligand, including a BAFF or APRIL homotrimer, a BAFF/APRIL heterotrimer or a BAFF 60mer, sufficient for a therapeutic effect. The particular amount can be determined experimentally or empirically. In some embodiments, the amount can be empirically determined from in vitro binding data or from animal models.

[0432] In some embodiments, the TACI-Fc fusion protein, or pharmaceutical compositions thereof, may be administered every 3 to 4 days, once every week, biweekly, every three weeks, once a month, once every two months, or once every three months. The precise timing and frequency can be empirically determined by a skilled clinician or physician, such as depending on the particular half-life and clearance rate of the particular formulation. The frequency of dosing will depend upon the pharmacokinetic parameters of the molecule in the formulation used. Typically, a composition is administered until a dosage is reached that achieves the desired effect. The composition may therefore be administered as a single dose, or as multiple doses (at the same or different concentrations/dosages) over time, or as a continuous infusion. Further refinement of the appropriate dosage is routinely made. Appropriate dosages may be ascertained through use of appropriate dose-response data.

[0433] In some cases, for example when a chronic inflammatory or autoimmune disorder is treated with a pharmaceutical composition provided herein, such as a TACI-Fc fusion protein provided herein, the composition is administered continuously, e.g., repeatedly, over time or intermittently over time. The duration of administration can be for weeks, months or years. In

some cases, treatment of a chronic inflammatory or autoimmune disorder, e.g., with a pharmaceutical composition provided herein, such as a containing a TACI-Fc fusion protein provided herein, may include administering the treatment to a subject indefinitely. In some embodiments, when the inflammatory or autoimmune disorder is a chronic inflammatory or autoimmune disorder, treatment with a pharmaceutical composition provided herein, such as a TACI-Fc fusion protein provided herein, is continued following remission or partial remission of the disease and/or a reduction or amelioration in signs and/or symptoms of a disease, such as a reduction of one or more signs of inflammation in a subject having the chronic inflammatory or autoimmune disorder. In some embodiments, administration continues until any time as desired by a skilled practitioner. In some cases, for example when an acute inflammatory or autoimmune disorder is treated with a pharmaceutical composition provided herein, such as a TACI-Fc fusion protein provided herein, the composition is administered for a defined or limited period of time. In some embodiments, when the inflammatory or autoimmune disorder is an acute inflammatory or autoimmune disorder, treatment with a pharmaceutical composition provided herein, such as a TACI-Fc fusion protein provided herein, is discontinued following remission or partial remission of the disease and/or a reduction or amelioration in signs and/or symptoms of a disease, such as a reduction of one or more signs of inflammation in a subject having the acute inflammatory or autoimmune disorder. In some embodiments, administration is discontinued at any time as desired by a skilled practitioner.

[0434] Typically, precise amount of the compositions of the present invention to be administered can be determined by a physician with consideration of individual differences in age, weight, tumor size, extent of infection or metastasis, and condition of the patient (subject). In some embodiments, when referencing dosage based on mg/kg of the subject, an average human subject is considered to have a mass of about 70 kg-75 kg, such as 70 kg and a body surface area (BSA) of 1.73 m².

[0435] In some embodiments, the dosage of the pharmaceutical composition is a single dose or a repeated dose. In some embodiments, the doses are given to a subject once per day, twice per day, three times per day, or four or more times per day. In some embodiments, about 1 or more (such as about 2 or more, about 3 or more, about 4 or more, about 5 or more, about 6 or more, or about 7 or more) doses are given in a week. In some embodiments, multiple doses are given over the course of days, weeks, months, or years. In some embodiments, a course of treatment is about 1 or more doses (such as about 2 or more doses, about 3 or more doses, about 4 or more doses, about 5 or more doses, about 7 or more doses, about 10 or more doses, about 15

or more doses, about 25 or more doses, about 40 or more doses, about 50 or more doses, or about 100 or more doses).

[0436] In particular embodiments, a TACI-Fc fusion protein is administered as a plurality of doses where each dose is administered no more than once weekly. In some embodiments, each dose is administered once a week (Q1W). In some embodiments, each dose is administered once every two weeks (Q2W). In some embodiments, each dose is administered once every three weeks (Q3W). In some embodiments, each dose is administered once every four weeks (Q4W). In some embodiments, each dose is administered once every two months (e.g. Q8W). In some embodiments, each dose is administered once every three months (e.g. Q12W). In aspects of provided embodiments, the administration cycle is repeated a plurality of times to administer a plurality of doses of the TACI-Fc fusion protein. In some embodiments, the administration is continued for a predetermined period of time, e.g. 4 weeks, 6 weeks, 8 weeks, 3 months, 6 months, 1 year or more. In some embodiments, the administration is discontinued after relapse or progression of the disease or condition in the subject.

[0437] In some embodiments, a dose regimen as described herein is administered to achieve a therapeutically effective amount to treat the disease, disorder or condition in the subject in need thereof. In some embodiments, each dose of the TACI-Fc fusion protein is administered in an amount between at or about 2.4 mg and at or about 960 mg, inclusive. In some embodiments, each dose of the TACI-Fc fusion protein is administered in an amount between at or about 8 mg and at or about 960mg, between at or about 8 mg and at or about 880 mg, between at or about 8 mg and at or about 800 mg, between at or about 8 mg and at or about 720 mg, between at or about 8 mg and at or about 640 mg, between at or about 8 mg and at or about 560 mg, between at or about 8 mg and at or about 480 mg, between at or about 8 mg and at or about 400 mg, between at or about 8 mg and at or about 320 mg, between at or about 8 mg and at or about 240 mg, between at or about 8 mg and at or about 160 mg, between at or about 8 mg and at or about 80 mg, between at or about 8 mg and at or about 40 mg, between at or about 40 mg and at or about 960mg, between at or about 40 mg and at or about 880 mg, between at or about 40 mg and at or about 800 mg, between at or about 40 mg and at or about 720 mg, between at or about 40 mg and at or about 640 mg, between at or about 40 mg and at or about 560 mg, between at or about 40 mg and at or about 480 mg, between at or about 40 mg and at or about 400 mg, between at or about 40 mg and at or about 320 mg, between at or about 40 mg and at or about 240 mg, between at or about 40 mg and at or about 160 mg, between at or about 40 mg and at or about 80 mg, between at or about 80 mg and at or about 960mg, between at or about 80 mg

between at or about 720 mg and at or about 880 mg, between at or about 720 mg and at or about 800 mg, between at or about 800 mg at at or about 960 mg, between at or about 800 mg and at or about 880 mg or between at or about 880 mg and at or about 960 mg, each inclusive.

[0438] In some embodiments, each dose of the TACI-Fc fusion protein is administered in an amount between at or about 8 mg and at or about 20 mg, between at or about 20 mg and at or about 960mg, between at or about 20 mg and at or about 880 mg, between at or about 20 mg and at or about 800 mg, between at or about 20 mg and at or about 720 mg, between at or about 20 mg and at or about 640 mg, between at or about 20 mg and at or about 560 mg, between at or about 20 mg and at or about 480 mg, between at or about 20 mg and at or about 400 mg, between at or about 20 mg and at or about 320 mg, between at or about 20 mg and at or about 240 mg, between at or about 20 mg and at or about 160 mg, between at or about 20 mg and at or about 40 mg, each inclusive.

[0439] In some embodiments, each dose of the TACI-Fc fusion protein is administered in an amount between at or about 8 mg and at or about 20 mg, between at or about 20 mg and at or about 960mg, between at or about 20 mg and at or about 880 mg, between at or about 20 mg and at or about 800 mg, between at or about 20 mg and at or about 720 mg, between at or about 20 mg and at or about 640 mg, between at or about 20 mg and at or about 560 mg, between at or about 20 mg and at or about 480 mg, between at or about 20 mg and at or about 400 mg, between at or about 20 mg and at or about 320 mg, between at or about 20 mg and at or about 240 mg, between at or about 20 mg and at or about 160 mg, between at or about 20 mg and at or about 40 mg, each inclusive.

[0440] In some embodiments, each dose of a TACI-Fc fusion protein is or is about 2.4 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 8 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 20 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 24 mg. In some embodiments, each dose of a TACI-Fc fusion proteion is or is about 40 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 80 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 160 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 240 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 320 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 400 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 480 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 560 mg. In some

embodiments, each dose of a TACI-Fc fusion protein is or is about 640 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 720 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 800 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 880 mg. In some embodiments, each dose of a TACI-Fc fusion protein is or is about 960 mg.

[0441] In some embodiments, the dose is an amount between or between about 40 mg and at or about 480 mg, between at or about 80 mg to at or about 320 mg, or between at or at or about 80 mg to at or about 120 mg, each inclusive.

[0442] In some embodiments, each dose of the TACI-Fc fusion protein is administered once every three months. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 160 mg to at or about 960 mg once every three months. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 240 mg to at or about 800 mg once every three months. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 480 mg to at or about 720 mg once every three months.

[0443] In some embodiments, each dose of the TACI-Fc fusion protein is administered once every other month (Q4W). In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 2.4 mg to at or about 960 mg Q4W. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 80 mg to at or about 720 mg Q4W. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 160 mg to at or about 560 mg Q4W. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 240 mg to at or about 480 mg Q4W. In some embodiments, the TACI-Fc fusion protein is administered at or about 80 mg Q4W. In some embodiments, the TACI-Fc fusion protein is administered at or about 160 mg Q4W. In some embodiments, the TACI-Fc fusion protein is administered at or about 240 mg Q4W. In some embodiments, the TACI-Fc fusion protein is administered subcutaneously. In some embodiments, the TACI-Fc fusion protein is administered intravenously.

[0444] In some embodiments, each dose of the TACI-Fc fusion protein is administered once every other week (Q2W). In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 2.4 mg to at or about 960 mg Q2W. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 80 mg to at or about 720 mg Q2W. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 160 mg to at or about 560 mg Q2W. In some embodiments, the TACI-Fc fusion

protein is administered in an amount from at or about 240 mg to at or about 480 mg Q2W. In some embodiments, the TACI-Fc fusion protein is administered at or about 80 mg Q2W. In some embodiments, the TACI-Fc fusion protein is administered at or about 160 mg Q2W. In some embodiments, the TACI-Fc fusion protein is administered at or about 240 mg Q2W. In some embodiments, the TACI-Fc fusion protein is administered subcutaneously. In some embodiments, the TACI-Fc fusion protein is administered intravenously.

[0445] In some embodiments, each dose of the TACI-Fc fusion protein is administered once a week (Q1W). In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 2.4 mg to at or about 960 mg Q1W. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 40 mg to at or about 480 mg Q1W. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 80 mg to at or about 320 mg Q1W. In some embodiments, the TACI-Fc fusion protein is administered in an amount from at or about 80 mg and at or about 120 mg Q1W.

[0446] It is contemplated that dosing (e.g., multiple doses), can continue until any time as desired by a skilled practitioner. For example, dosing may continue until a desirable disease response is achieved, such as in remission or partial remission of the disease and/or a reduction or amelioration in signs and/or symptoms of a disease, such as a reduction of one or more signs of inflammation in the subject. In some embodiments, the dosing is continued following remission or partial remission of the disease and/or a reduction or amelioration in signs and/or symptoms of a disease, such as a reduction of one or more signs of inflammation in the subject.

[0447] The administration of the subject compositions may be carried out in any convenient manner, including by aerosol inhalation, injection, ingestion, transfusion, implantation or transplantation. The compositions described herein may be administered to a patient subcutaneously, intradermally, intratumorally, intranodally, intramedullary, intramuscularly, by intravenous (i.v.) injection, or intraperitoneally. In one embodiment, the therapeutic composition is administered to a patient by intradermal or subcutaneous injection. In another embodiment, the therapeutic composition is administered by i.v. injection.

[0448] In some embodiments, the pharmaceutical composition (including pharmaceutical compositions comprising any of the TACI-Fc fusion proteins described herein) is administered to a subject through any route, including orally, transdermally, by inhalation, intravenously, intra-arterially, intramuscularly, direct application to a wound site, application to a surgical site, intraperitoneally, by suppository, subcutaneously, intradermally, transcutaneously, by

nebulization, intrapleurally, intraventricularly, intra-articularly, intraocularly, intraspinally, intratumorally or systemically.

[0449] In some embodiments, the pharmaceutical composition (including pharmaceutical compositions comprising any of the TACI-Fc fusion proteins described herein) is administered to a subject via subcutaneous administrations. In some embodiments, the dose of the TACI-Fc fusion for subcutaneous administration is at or about 80 mg. In some embodiments, the dose of the TACI-Fc fusion for subcutaneous administration is at or about 240 mg. In some embodiments, the dose of the TACI-Fc fusion for subcutaneous administration is at or about 480 mg. In some embodiments, the dose of the TACI-Fc fusion for subcutaneous administration is at or about 720 mg. In some embodiments, each dose is administered subcutaneously Q1W. In some embodiments, each dose is administered subcutaneously Q2W. In some embodiments, each dose is administered subcutaneously Q4W (i.e. once a month).

[0450] In some embodiments, the pharmaceutical composition (including pharmaceutical compositions comprising any fo the TACI-Fc fusion proteins described herein) is administered to a subject via intravenous administration. In some embodiments, the dose of the TACI-Fc fusion for intravenous administration is at or about 2.4 mg. In some embodiments, the dose of the TACI-Fc fusion for intravenous administration is at or about 8 mg. In some embodiments, the dose of the TACI-Fc fusion for intravenous administration is at or about 24 mg. In some embodiments, the dose of the TACI-Fc fusion for intravenous administration is at or about 80 mg. In some embodiments, the dose of the TACI-Fc fusion for intravenous administration is at or about 240 mg. In some embodiments, the dose of the TACI-Fc fusion for intravenous administration is at or about 480 mg. In some embodiments, the dose of the TACI-Fc fusion for intravenous administration is at or about 720 mg. In some embodiments, each dose is administered intravenously Q1W. In some embodiments, each dose is administered intravenously Q2W. In some embodiments, each dose is administered intravenously Q4W (i.e. once a month).

[0451] In some embodiments, the pharmaceutical composition (including pharmaceutical compositions comprising any fo the TACI-Fc fusion proteins described herein) is administered parenterally. In some embodiments, the pharmaceutical composition is in a form suitable for infusion injection, for example by intravenous injection. In some embodiments, the infusion duration is, is at least, or is about 30 minutes, 40 minutes, 50 minutes, 1 hour, 1.5 hours, 2 hours, 3 hours, 4 hours, 5 hours or 6 hours. In some embodiments the infusion duration is between about 30 minutes and 6 hours. In some embodiments, the infusion duration is between about 30

minutes and 5 hours. In some embodiments, the infusion duration is between about 30 minutes and 4 hours. In some embodiments, the infusion duration is between about 30 minutes and 3 hours. In some embodiments, the infusion duration is between about 30 minutes and 2 hours. In some embodiments, the infusion duration is between about 30 minutes and 1 hour. In some embodiments, the infusion duration is or is about 30 minutes.

[0452] In some embodiments, a dosing regimen may include intravenous and subcutaneous dosing. In some embodiments, an initial loading dose may be administered intravenously, followed by a maintenance dose(s) administered subcutaneously. In some embodiments, there is provided a load/maintenance regimen, in which an intravenous dose is given one time, followed by a subcutaneous dose on the same day, and then followed by administration of administration of maintenance doses subcutaneously once a week to once every three weeks. In some embodiments, the maintenance dose is administered once a week (Q1W). In some embodiments, the maintenance dose is administered one every two weeks (Q2W). In some embodiments, the maintenance dose is administered once a month (Q4W). In some embodiments, the maintenance dose is administered once every three months (Q12W).

[0453] In some embodiments, the dosing regimen may also include an intermediate/step down regimen in which the dose amount and/or frequency of administration is reduced over time. In some embodiment, the immunomodulatory protein (e.g. TACI-Fc fusion protein) is administered once a week (Q1W) for four weeks, and then is administered once a month (Q4W). In some embodiments, the immunomodulatory protein (e.g. TACI-Fc fusion protein) is administered once a week (Q1W) for four weeks, and then is administered once a week (Q1W) or once every two weeks (Q2W) for two to four weeks, and then is administered once every three months (Q12W).

[0454] In some embodiments, the dosing regimen may also include an intermediate/step down regimen in which the dose amount and/or frequency of administration is reduced over time. In some embodiment, the immunomodulatory protein (e.g. TACI-Fc fusion protein) is administered once a week (Q1W) for three to four doses, and then is administered once a month (Q4W). In some embodiments, the immunomodulatory protein (e.g. TACI-Fc fusion protein) is administered once a week (Q1W) for three four doses, and then is administered once a week (Q1W) or once every two weeks (Q2W) for two to four weeks, and then is administered once every three months (Q12W). In some embodiment, the immunomodulatory protein (e.g. TACI-Fc fusion protein) is administered once every other week (Q2W) for three to four doses, and then is administered once a month (Q4W). For instance, in some embodiments, the Q1W or

Q2W dose is given for 3-4 doses then monthly (Q4W) at that dose or a higher dose. In some embodiments, at or about 80 mg is administered Q1W or Q2W for 3-4 doses and then monthly (Q4W) at that dose or a higher dose (e.g. 160 mg or 240 mg).

[0455] In some embodiments, the administration of the provided immunomodulatory protein, such as TACI-Fc fusion protein, in accord with the provided methods continues for a desired time as determined by a treating physician or investigator. In some embodiments, the administration is continued until the subject exhibits a complete response or clinical remission. In some embodiments, the administration of the provided immunomodulatory protein, such as TACI-Fc fusion protein, in accord with the provided methods continues for a treatment period. In some embodiments, the treatment period is for at or about 6 months to 3 years, such as at or about 24 weeks, 36 weeks, 48 weeks, 1 year (e.g. 52 weeks), 2 years or 3 years. In some embodiments, the administration is continued until such time as the subjects symptoms are worsening or the disease or condition has progressed or relapsed in the subject following a remission.

[0456] In some embodiments, the pharmaceutical composition is administered as a monotherapy (i.e., as a single agent) or as a combination therapy (i.e., in combination with one or more additional immunosuppressant agents). In some embodiments, the additional agent is a glucocorticoid (e.g., prednisone, dexamethasone, and hydrocortisone), cytostatic agent, such as a cytostatic agent that affect proliferation of T cells and/or B cells (e.g., purine analogs, alkylating agents, or antimetabolites), an antibody (e.g., anti-CD20, anti-CD25 or anti-CD3 monoclonal antibodies), cyclosporine, tacrolimus, sirolimus, everolimus, an interferon, an opioid, a TNF binding protein, mycophenolate, small biological agent, such as fingolimod or myriocin, cytokine, such as interferon beta-1a, an integrin agonist, or an integrin antagonist.

[0457] In some embodiments, the efficacy of the treatment is monitored in the subject. In some embodiments, the change in baseline over time in circulating levels of antibodies, such as autoantibodies are monitored in the subject. In some embodiments, the subject has LN and a change from baseline over time of circulating levels of anti-dsDNA is monitored in the subject. In some embodiments, the subject has IgAN and a change from baseline over time of circulating levels of GdIgA1 and anti-GdIgA1 is monitored in the subject. In some embodiments, the subject has pMN and a change from baseline over time of circulating levels of pMN and anti-MPO is monitored in the subject. In some embodiments, the subject has renal AAV and a change from baseline over time of circulating levels of anti-PR3 is monitored in the subject.

[0458] In some embodiments, a change in base line over time of a complement component is monitored in the subject. In some embodiments, the complement component is one or more of C3, C4 or CH50.

[0459] In some embodiments, a clinical response is monitored in the subject. In some embodiments, the clinical response may be assessed by monitoring baseline estimated glomerular filtration rate (eGFR) over time. In some embodiments, eGFR is calculated by an equation that uses serum creatine or cystatin C. In some embodiments, the eGFR is calculated by an equation that is independent of race, such as described in Inker et al., 2021 N Engl J Med., 385:1737-1749. In some embodiments, the eGFR may be estimated using the Chronic Kidney Disease Epidemiology Collaboration (CKD-EPI) formula.

[0460] In some embodiments, the response is measured as a renal response by determination of eGFR (e.g. using cystatin C race-independent equation). In some embodiments, the renal response is measured in subjects with LN or pMN.

[0461] In some embodiments, the subject has LN and complete renal response is present if the subject has UPCR less than 0.5 g/g (e.g. based on 24-hour urine collection) and eGFR is greater than or equal to the lower limit of normal (LLN) or there has been a less than 20% decrease in eGFR from baseline where the eGFR is less than LLN. In some embodiments, the subject has LN and a partial renal response is present if the subject has UPCR less than or equal to 3.5 g/g and a greater than 50% reduction from baseline (e.g. based on 24-hour urine collection), and eGFR is greater than or equal to 60 mL/min/1.73m² or there is a less than a 20% decrease of eGFR from baseline.

[0462] In some embodiments, the subject has pMN and complete renal response is present if the subject has UPCR less than 0.3 g/g (e.g. based on 24-hour urine collection), serum albumin greater than 35 g/L, and eGFR is greater than or equal to 60 mL/min/1.73m². In some embodiments, the subject has pMN and a partial renal response is present if the subject has UPCR less than or equal to 3.5 g/g and a greater than 50% reduction from baseline (e.g. based on 24-hour urine collection), serum albumin greater than 30 g/L, and stable eGFR (e.g. decline of less than 15% compared to baseline).

[0463] In some embodiments of the methods, the treating can result in a clinical remission. In some aspects, the treating can result in a clinical remission without about 1 week, about 2 weeks, about 3 weeks, about 4 weeks, about 5 weeks, about 6 weeks, about 7 weeks, about 9 weeks, about 10 weeks, about 11 weeks, about 12 weeks, about 14 weeks, about 16 weeks, about 18 weeks, about 20 weeks, about 22 weeks, about 24 weeks, about 26 weeks, about 28

weeks, about 30 weeks, about 32 weeks, about 34 weeks, about 36 weeks, about 38 weeks, about 40 weeks, about 42 weeks, about 44 weeks, about 46 weeks, about 48 weeks, about 50 weeks, about 52 weeks, about 54 weeks, about 56 weeks, about 58 weeks, about 60 weeks, about 62 weeks, about 64 weeks, about 66 weeks, about 68 weeks, about 70 weeks, about 72 weeks, about 74 weeks, about 76 weeks, about 78 weeks, or about 80 weeks from the first dose. In some embodiments, the treating results in a clinical remission within about 10 weeks from the first dose. In some embodiments, the treating results in a clinical remission within about 6 weeks from the first dose. In some embodiments, the treating results in a clinical remission at about 6 weeks from the first dose and at about 10 weeks from the first dose.

In some embodiments of any of the preceding methods, the clinical remission is a sustained remission. For example, in some embodiments, the sustained remission is a clinical remission at about 10 weeks, about 15 weeks, about 20 weeks, about 25 weeks, about 30 weeks, about 35 weeks, about 40 weeks, about 45 weeks, about 50 weeks, about 52 weeks, about 55 weeks, about 60 weeks, about 65 weeks, about 70 weeks, about 72 weeks, about 75 weeks, about 80 weeks, about 85 weeks, about 90 weeks, about 95 weeks, about 100 weeks, about 102 weeks, about 105 weeks, or about 110 weeks from the first dose. In some embodiments, the sustained remission is a clinical remission at about ten weeks from the first dose and at about 30 weeks from the first dose. In some embodiments, the sustained remission has a length of at least about 30 weeks, or at least about 7, about 8, about 9, about 10, about 11, or about 12 months. In some embodiments of any of the preceding aspects, the amelioration of one or more symptoms of the disease or condition, clinical remission, and/or clinical response is maintained at least one month (e.g., at least one month, at least two months, at least three months, at least four months, at least five months, at least six months, at least seven months, at least eight months, at least nine months, at least ten months, at least eleven months, at least twelve months, or longer) after the end of treatment.

VII. ARTICLES OF MANUFACTURE AND KITS

[0464] Also provided herein are articles of manufacture that comprise the pharmaceutical compositions described herein in suitable packaging. Suitable packaging for compositions (such as ophthalmic compositions) described herein are known in the art, and include, for example, vials (such as sealed vials), vessels, ampules, bottles, jars, flexible packaging (e.g., sealed Mylar or plastic bags), and the like. These articles of manufacture may further be sterilized and/or sealed.

[0465] Further provided are kits comprising the pharmaceutical compositions (or articles of manufacture) described herein, which may further comprise instruction(s) on methods of using the composition, such as uses described herein. The kits described herein may also include other materials desirable from a commercial and user standpoint, including other buffers, diluents, filters, needles, syringes, and package inserts with instructions for performing any methods described herein.

VIII. EXEMPLARY EMBODIMENTS

[0466] Among the provided embodiments are:

1. A method of treating an inflammatory or autoimmune disease or disorder, the method comprising administering to the subject a TACI-Fc fusion protein that is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D in the amino acid sequence set forth in SEQ ID NO:13, wherein the TACI-Fc fusion protein is administered at a dose of from at or about 8 mg to at or about 960 mg once every week up to once every three months.
2. The method of embodiment 1, wherein the dose of the TACI-Fc fusion protein is administered once every three months.
3. The method of embodiment 1, wherein the dose of the TACI-Fc fusion protein is administered once every month (Q4W).
4. The method of embodiment 1, wherein the dose of the TACI-Fc fusion protein is administered once every other week (Q2W).
5. The method of embodiment 1, wherein the dose of the TACI-Fc fusion protein is administered once a week (Q1W).
6. The method of any of embodiments 1-5, wherein the TACI-Fc fusion protein is administered at a dose of from at or about 80 mg to at or about 720 mg, from at or about 160 mg to at or about 560 mg or from at or about 240 mg to at or about 480 mg.
7. The method of any of embodiments 1-6, wherein the TACI-Fc fusion protein is administered at a dose of from at or about 20 mg to at or about 720 mg, from at or about 40 mg to at or about 480 mg, from at or about 80 mg to at or about 320 mg, or from at or at or about 80 mg to at or about 120 mg.
8. The method of any of embodiments 1-7, wherein the TACI-Fc fusion protein is administered at a dose of from at or about 240 mg to from at or about 480 mg once.

9. The method of any of embodiments 1-8, wherein the TACI-Fc fusion is administered at a dose from at or about 80 mg to at or about 120 mg.
10. The method of any of embodiments 1-9, wherein the variant TACI polypeptide is set forth in SEQ ID NO:26.
11. The method of any of embodiments 1-10, wherein the linker is selected from GSGGS (SEQ ID NO: 76), GGGGS (G4S; SEQ ID NO: 77), GSGGGGS (SEQ ID NO: 74), GGGGSGGGGS (2xGGGGGS; SEQ ID NO: 78), GGGGSGGGGSGGGGS (3xGGGGGS; SEQ ID NO: 79), GGGGSGGGGSGGGGSGGGGS (4xGGGGGS, SEQ ID NO:84), GGGGSGGGGSGGGGSGGGGSGGGGS (5xGGGGGS, SEQ ID NO: 91), GGGGSSA (SEQ ID NO: 80), or GSGGGGSGGGGS (SEQ ID NO:194) or combinations thereof.
12. The method of any of embodiments 1-11, wherein the linker is set forth in SEQ ID NO: 74.
13. The method of any of embodiments 1-12, wherein the Fc is an IgG1 Fc domain.
14. The method of any of embodiments 1-13, wherein the Fc is a variant IgG1 Fc that exhibits reduced binding affinity to an Fc receptor and/or reduced effector function as compared to a wild-type IgG1 Fc domain.
15. The method of embodiment 14, wherein the variant IgG1 Fc domain comprises one or more amino acid substitutions selected from L234A, L234V, L235A, L235E, G237A, S267K, R292C, N297G, and V302C, by EU numbering.
16. The method of embodiment 14 or embodiment 15, wherein the variant IgG1 Fc comprises the amino acid substitutions L234A, L235E, and G237A by EU numbering.
17. The method of any of embodiments 13-16, wherein the Fc comprises the amino acid substitution C220S, wherein the residues are numbered according to the EU index of Kabat.
18. The method of any of embodiments 13-17, wherein the Fc lacks the hinge sequence EPKSS or EPKSC.
19. The method of any of embodiments 13-18, wherein the Fc region comprises K447del, wherein the residue is numbered according to the EU index of Kabat.
20. The method of embodiment 1-17 and 19, wherein the Fc comprises the amino acid sequence set forth in SEQ ID NO:73.
21. The method of any of embodiments 1-17, 19 and 20, wherein the TACI-Fc fusion protein is set forth in SEQ ID NO: 167.
22. The method of embodiment 1-13, 17 and 19, wherein the Fc comprises the amino acid sequence set forth in SEQ ID NO:81.

23. The method of any of embodiments 1-13, 17, 19, and 22, wherein the TACI-Fc fusion protein is set forth in SEQ ID NO: 168.
24. The method of any one of embodiments 1-23, wherein the administration is via intravenous administration.
25. The method of any one of embodiments 1-23, wherein the administration is via subcutaneous administration.
26. The method of any of embodiment 1-25, wherein a B cell immune response or activity is reduced in the subject.
27. The method of any of embodiments 1-26, wherein circulating serum immunoglobulins are reduced in the subject.
28. The method of any of embodiments 1-27, wherein one or more of B cell maturation, differentiation, and/or proliferation is reduced or inhibited.
29. The method of any of embodiments 1-28, wherein circulating levels of an APRIL or BAFF protein are reduced in the subject, optionally wherein the APRIL or BAFF protein is a APRIL homotrimer, BAFF homotrimer, APRIL/BAFF heterotrimer, or BAFF 60mer.
30. The method of any of embodiments 1-29, wherein the disease or disorder is a B cell-mediated disease or disorder.
31. The method of any of embodiments 1-30, wherein the disease or disorder is an autoimmune disease, and inflammatory condition, a B cell cancer, an antibody-mediated pathology, a renal disease, a graft rejection, graft versus host disease, or a viral infection.
32. The method of embodiment any of embodiments 1-31, wherein the disease or disorder is selected from the group consisting of systemic lupus erythematosus (SLE), lupus nephritis, cutaneous lupus erythematosus, Sjögren's syndrome, scleroderma (systemic sclerosis), multiple sclerosis, diabetes (e.g. Type I diabetes), polymyositis, primary biliary cirrhosis, IgG4-related disease, IgA nephropathy, IgA vasculitis, ANCA vasculitis (microscopic polyangiitis, granulomatosis with polyangiitis [Wegener's granulomatosis], eosinophilic granulomatosis with polyangiitis [Churg-Strauss]) cryoglobulinemia, cold agglutinin or warm agglutinin disease, immune thrombocytopenic purpura, optic neuritis, amyloidosis, antiphospholipid antibody syndrome (APS), autoimmune polyglandular syndrome type II (APS II), autoimmune thyroid disease (AITD), Graves' disease, autoimmune adrenalitis, pemphigus vulgaris, bullous pemphigoid, myasthenia gravis, graft versus host disease (GVHD), transplantation, rheumatoid arthritis, acute lupus nephritis, amyotrophic lateral sclerosis, neuromyelitis optica, transverse myelitis, Rasmussen's encephalitis, CNS autoimmunity, Guillain-Barre syndrome, chronic

inflammatory demyelinating polyneuropathy, neurocystercercosis, sarcoidosis, antiphospholipid antibody syndrome, IgG4-related disease, Hashimoto's thyroiditis, immune thrombocytopenia, Addison's Disease, and dermatomyositis.

33. The method of any of embodiments 1-31, wherein the disease or disorder is a B cell cancer.

34. The method of embodiment 33, wherein the B cell cancer is myeloma, B cell chronic lymphocytic leukemia, Waldenstrom's macroglobulinemia or non-Hodgkin's lymphoma.

35. The method of any of embodiments 1-34, wherein the subject is a human.

IX. EXAMPLES

[0467] The following examples are included for illustrative purposes only and are not intended to limit the scope of the invention.

Example 1. Identification of Affinity Modified TACI

[0468] This Example describes the generation of mutant DNA constructs of human TACI TNFR domains (TD) for translation and expression on the surface of yeast as yeast display libraries, introduction of DNA libraries into yeast, and selection of yeast cells expressing affinity-modified variants of the extracellular domain (ECD) of TACI containing at least one TD (TACI vTD). The selected TACI vTD were then formatted as Fc fusion proteins.

A. Generation of Mutant DNA constructs of TACI TNFR Domains

[0469] Libraries containing random substitutions of amino acids were constructed to identify variants of the extracellular domain (ECD) of TACI. Constructs were generated based on a wildtype human TACI sequence containing an ECD portion of TACI that included either (1) both cysteine-rich protein domains (CRD, CRD1/CRD2) as set forth in SEQ ID NO: 1 (corresponding to residues 29-110 as set forth in UniProt Accession No. O14836), or (2) only a single CRD (CRD2) as set forth in SEQ ID NO: 13 (corresponding to residues 68-110 as set forth in UniProt Accession No. O14836).

TACI ECD (29-110) (SEQ ID NO: 1):

VAMRSCP EEQYWDPLLGT C M SCKTICNHQSQR TCAAFCRSLSCRKEQGKFYDHLLR
DCISCASICGQHPKQCAYFCENKLRS

TACI ECD (68-110) (SEQ ID NO: 13):

SLSCRKEQGKFYDHLRLDCISCASICGQHPKQCAYFCENKLRS

[0470] DNA encoding the wild-type TACI ECD domain was cloned between the BamHI and KpnI sites of the modified yeast expression vector PBYDS03 (Life Technologies USA) which placed the TACI ECD N-terminal to the yeast surface anchoring domain Sag1 (the C-terminal domain of yeast α -agglutinin) with an in-frame HA fusion tag N-terminal to the TACI ECD sequence and a c-Myc fusion tag C-terminal to the TACI ECD sequence. Expression in this vector is controlled through the inducible GAL1 promoter. After verification of the correct DNA sequence, the wild-type TACI ECD DNA construct was used as template for error-prone PCR to introduce random mutations across the TACI ECD sequence at a frequency of 2-5 mutations per gene copy. The Genemorph II Kit (Agilent, USA) was used in combination with titrating amounts of MnCl₂ from 0.0 to 0.6 mM to achieve the desired error rate. After error-prone PCR, the mutagenized DNA was gel purified using the NucleoSpin® Gel and PCR Cleanup kit (Macherey-Nagel, Germany). This isolated DNA fragment was then PCR amplified with OneTaq 2x PCR master mix (New England Biolabs, USA) using primers containing 48 bp overlap regions homologous to pBYDS03 for preparation for large scale yeast electroporation. The TACI ECD DNA insert was gel-purified and resuspended in sterile, deionized water at a nominal concentration of 500 ng/ μ L.

[0471] To prepare the vector for transformation, pBYDS03 was digested with BamHI-HF and KpnI-HF restriction enzymes (New England Biolabs, USA) and the large vector fragment (expected size: 7671 bp) was gel-purified and dissolved in sterile, deionized water at a nominal concentration of 500 ng/ μ L. To prepare for yeast transformation, 12 μ g of library DNA insert was mixed with 4 μ g of linearized vector for each electroporation.

[0472] To introduce random DNA libraries into yeast, the *Saccharomyces cerevisiae* strain BJ5464 (ATCC.org; ATCC number 208288) was prepared immediately prior to electroporation as detailed in Benatuil, L. et.al., Protein Eng Des Sel. 2010 Apr;23(4):155-159. Briefly, an overnight stationary-phase culture of BJ5464 was passaged to OD₆₀₀ 0.3 in 100 mL YPD medium (10 g/L yeast nitrogen base, 20 g/L Peptone and 20 g/L D-(+)-Glucose) and placed in a platform shaker at 30 °C and 300 rpm until the inoculated cultures reached OD₆₀₀ 1.6. After ~5 hours, cells were harvested by centrifugation and kept on ice for the remainder of the protocol unless otherwise stated. After harvesting, cells were washed twice with 50 mL ice-cold water and once with electroporation buffer (1 M Sorbitol, 1 mM CaCl₂). Collected cells were

conditioned by re-suspending in 20 mL 0.1 M LiAc/10 mM DTT and shaking at 225 rpm in a culture flask for 30 minutes at 30 °C. Conditioned cells were immediately centrifuged, washed twice with electroporation buffer, and resuspended with ~100-200 µl of electroporation buffer to bring the volume to 1 mL. This conditioned cell suspension was sufficient for two electroporation reactions in 400 µl cuvettes.

[0473] For each electroporation, 12 µg of library DNA insert and 4 µg of linearized pBYDS03 vector (described above) was mixed with 400 µl of electrocompetent BJ5464 and transferred to a pre-chilled BioRad GenePulser cuvette with 2 mm electrode gap. The mixtures were kept on ice for 5 minutes, prior to electroporation using a BTX ECM399 exponential decay wave electroporation system at 2500V. Immediately following electroporation, cells were added to 8 mL of 1:1 mixture of 1 M Sorbitol:1X YPD, and left at room temperature without shaking for 10 min, then placed on platform shaker for 1 hr at 225 rpm and 30 °C. Cells were collected by centrifugation and resuspended in 250 mL SCD-Leu medium to accommodate the LEU2 selective marker carried by modified plasmid pBYDS03. One liter of SCD-Leu media was generated with 14.7 gm sodium citrate, 4.29 gm citric acid monohydrate, 20 gm dextrose, 6.7 gm yeast nitrogen base, and 1.6 gm yeast synthetic drop-out media supplement without leucine. The medium was filter sterilized before use using a 0.22 µm vacuum filter device. Library size was estimated by spotting serial dilutions of freshly recovered cells on an SCD-Leu agar plate in the dilution range of 10^{-5} to 10^{-10} and extrapolating by counting colonies after three days. The remainder of the electroporated culture was grown to saturation and cells from this culture were subcultured 1/100 into the same medium once more and grown to saturation to minimize the fraction of untransformed cells and to allow for segregation of plasmid from cells that may contain two or more library variants. To maintain library diversity, this subculturing step was carried out using an inoculum that contained at least 10x more cells than the calculated library size. Cells from the second saturated culture were resuspended in fresh medium containing sterile 25% (weight/volume) glycerol to a density of 1×10^{10} /mL and frozen and stored at -80°C (frozen library stock).

[0474] A number of cells equal to at least 10 times the estimated library size were thawed from individual library stocks, suspended to 0.5×10^7 cells/mL in non-inducing SCD-Leu medium, and grown overnight. The next day, a number of cells equal to 10 times the library size were centrifuged at 2000 RPM for two minutes and resuspended to 0.5×10^7 cells/mL in inducing SCDG-Leu media. One liter of SCDG-Leu induction media was generated with 5.4 gm Na_2HPO_4 , 8.56 gm $\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$, 20 gm galactose, 2.0 gm dextrose, 6.7 gm yeast nitrogen

base, and 1.6 gm yeast synthetic drop out media supplement without leucine dissolved in water and sterilized through a 0.22 μ m membrane filter device. The culture was grown in induction medium overnight at 30 °C to induce expression of library proteins on the yeast cell surface.

[0475] Following overnight induction of the TACI ECD libraries, a number of cells equivalent to 10 times the estimated library diversity were sorted by magnetic separation using Dynabeads™ His-Tag magnetic beads preloaded with BAFF-9xHis to enrich for TACI ECD variants with the ability to bind their exogenous recombinant counter-structure proteins. The outputs from the magnetic separation were used in a subsequent FACS selection scheme involving four rounds of positive selections alternating between BAFF-9xHis and APRIL-FLAG, with simultaneous 10-fold reduction in counter structure concentration each round (e.g., FACS1: 50 nM APRIL-FLAG; FACS4: 0.05 nM BAFF-9xHis). The incubation volume was adjusted to maintain at least a 10-fold stoichiometric excess of counter structure over the total number of yeast-displayed TACI ECD variant molecules (assuming 100,000 copies of protein per cell) to avoid ligand depletion artifacts which can reduce library discrimination. Binding of BAFF-9xHis and APRIL-FLAG to TACI ECD variants was detected with PE conjugated anti-6xHis tag antibody (BioLegend, USA) and PE conjugated anti-FLAG-tag antibody, respectively. Variants from FACS3 and FACS4 outputs were isolated for DNA sequencing and subsequent cloning for recombinant Fc fusion expression.

[0476] A second cycle of random mutagenesis was carried out on yeast cell outputs from the FACS4 BAFF-9xHis selections described above. The positive selection protocol with alternating counter structures per sort was the same as the first cycle except that the order of counter structures was switched (e.g., FACS1: 50 nM BAFF-9xHis; FACS4: 0.05 nM APRIL-FLAG). Additional variants were chosen from FACS3 and FACS4 yeast cell outputs.

B. Reformatting Selection Outputs as Fc-Fusions

[0477] TACI ECD variant inserts from FACS3 and FACS4 outputs from both cycle 1 and cycle 2 selections, as described above, were subcloned into an Fc fusion vector for sequence analysis of individual clones To generate recombinant immunomodulatory proteins as Fc fusion proteins containing an ECD of TACI with at least one affinity-modified domain (e.g., variant TACI ECD-Fc), the encoding DNA was generated to encode a protein as follows: variant TACI domain followed by a linker of 7 amino acids (GSGGGGS; SEQ ID NO: 74) followed by a human IgG1 effectorless Fc sequence containing the mutations L234A, L235E and G237A, by the Eu Index numbering system for immunoglobulin proteins. Since the construct does not

include any antibody light chains that can form a covalent bond with a cysteine, the human IgG1 Fc also contained replacement of the cysteine residues to a serine residue at position 220 (C220S) by Eu Index numbering system for immunoglobulin proteins (corresponding to position 5 (C5S) with reference to the wild-type or unmodified Fc set forth in SEQ ID NO: 71). The Fc region also lacked the C-terminal lysine at position 447 (designated K447del) normally encoded in the wild type human IgG1 constant region gene (corresponding to position 232 of the wild-type or unmodified Fc set forth in SEQ ID NO: 71). The effectorless (inert) IgG1 Fc in the fusion constructs is set forth in SEQ ID NO:73.

[0478] Output cell pools from selected TACI ECD FACS sorts were grown to terminal density in SCD-Leu selection medium and plasmid DNA was isolated using a yeast plasmid DNA isolation kit (Zymoresearch, USA). For generation of Fc fusions, the affinity matured TACI ECD variants were PCR amplified with primers containing 40 bp homologous regions on either end with an AfeI and BamHI digested Fc fusion vector encoding and in-frame with the Fc region to carry out in vitro recombination using Gibson Assembly Master Mix (New England Biolabs). The Gibson Assembly reaction was added to the E. coli strain NEB5alpha (New England Biolabs, USA) for heat shock transformation following the manufacturer's instructions.

[0479] Dilutions of transformation reactions were plated onto LB-agar containing 100 µg/mL carbenicillin (Teknova, USA) to isolate single colonies for selection. Generally, up to 96 colonies from each transformation were then grown in 96 well plates to saturation overnight at 37°C in LB-broth containing 100 µg/mL carbenicillin (Teknova cat # L8112) and a small aliquot from each well was submitted for DNA sequencing to identify mutation(s) in all clones.

[0480] After sequence analysis and identification of clones of interest, plasmid DNA was prepared using the MidiPlus kit (Qiagen).

[0481] Recombinant variant Fc fusion proteins were produced from suspension-adapted human embryonic kidney (HEK) 293 cells using the Expi293 expression system (Invitrogen, USA). Supernatant was harvested and the Fc protein was captured on Mab SelectSure (GE Healthcare cat. no. 17543801). Protein was eluted from the column using 50mM Acetate pH3.6. The MabSelect Sure eluate was pooled and the pH was adjusted to above pH5.0. This material was then polished on a Preparative SEC column, to generate highly purified monomeric material. This material was buffer exchanged into 10mM Acetate, 9% Sucrose pH 5.0. The protein purity was assessed by analytic SEC. Material was vialled and stored at -80.

[0482] Amino acid substitutions in selected TACI vTDs that were identified and generated by the selection are set forth in Table 1. Selected vTDs, formatted as Fc fusion proteins, were tested for binding and functional activity as described in Example 2.

Example 2. Assessment of Activity of Fc fusion proteins.

[0483] This Example describes characterization of the activity of TACI domain-containing molecules, such as soluble wild-type (WT) or variant TACI vTDs formatted as Fc fusions, using a cell line-based *in vitro* bioassay.

[0484] Jurkat cells with a nuclear factor kappa-light-chain-enhancer of activated B cells (NF- κ B) luciferase-based reporter were purchased (BPS Bioscience). Jurkat/NF- κ B cells were transduced with lentivirus to yield stable, cell surface expression of mouse TACI (Jurkat/ NF- κ B/TACI). Cells expressing mouse TACI respond to both human and mouse APRIL or BAFF. Following binding of recombinant human or mouse APRIL or BAFF to TACI, endogenous NF- κ B transcription factors in the Jurkat cells bind to the DNA response elements controlling transcription of a firefly luciferase gene. Luciferase production was quantitated through the addition of a luciferin-containing substrate which, when oxidized, generates light that can be measured using a microplate reader. A schematic of the Jurkat/NF- κ B/TACI assay is shown in FIG. 1.

[0485] Recombinant human and mouse APRIL and BAFF ligands were purchased: human APRIL (Tonbo Biosciences); human BAFF (BioLegend); mouse APRIL (ProSci Incorporated); and mouse BAFF (R & D Systems).

[0486] To determine bioactivity of TACI WT or vTD domain-containing molecules, recombinant human or mouse APRIL or BAFF at varying concentrations (ranging 1 – 10 nM) in 30 μ L were incubated with fixed or titrated (ranging 40 nM – 66 pM) TACI domain-containing molecules in 30 μ L. Ligands and soluble receptors were incubated for 20 minutes with shaking at room temperature (RT). Fifty μ L was transferred to a 96-well, white flat-bottomed plate containing 1.5×10^5 Jurkat/NF- κ B/TACI cells/well in 50 μ L media (RPMI1640 + 5% fetal bovine serum [FBS]). Wells were mixed and plates incubated for 5 hours at 37° Celsius (C) in a humidified 5% CO₂ incubation chamber. Plates were removed from the incubator and 100 μ L of cell lysis and luciferase substrate solution (Bio-Glo™ Luciferase Assay System, Promega) was added to each well and the plates were incubated on an orbital shaker for 10 minutes. Relative luminescence values (RLU) were determined for each test sample by measuring luminescence with a 1 second per well integration time using a Cytation 3 (BioTek Instruments)

imaging reader. Decreased RLU in the presence of TACI WT or vTDs relative to control proteins represent blockade and inhibition of ligand signaling via the transduced TACI receptor in the Jurkat/NF- κ B/TACI cells.

[0487] As shown in FIG. 2, exemplary TACI-Fc vTDs, respectively, inhibit ligand signaling at levels equal to or greater than Fc fusion proteins containing WT TACI domains.

[0488] Similar experiments also were conducted to additionally assess functional blockade of cynomolgus monkey and rat APRIL-or BAFF-mediated signaling by the exemplary TACI-Fc fusion containing a vTD set forth in SEQ ID NO:26 (26 TACI CRD2-Fc) using a Jurkat/NF- κ B luciferase reporter cells transduced with TACI, substantially as described above. As shown in Table E1.A, the TACI-Fc fusion demonstrated blockade of APRIL- and BAFF-mediated signaling for all species tested.

Table E1.A: Cross-Species Inhibition of 26 TACI CRD2-Fc

Species of BAFF/APRIL	Signal Inhibition in Jurkat/NF- κ B/TACI cells	
	APRIL IC ₅₀ (nM)	BAFF IC ₅₀ (nM)
Human	3.4	2.8
Cynomolgus monkey	3.3	1.9
Rat	22.7	3.8
Mouse	24.5	15.2

Notes: APRIL = A proliferation inducing ligand; BAFF = B cell activating factor; IC₅₀ = Half maximal inhibitory concentration; NF- κ B = Nuclear factor kappa-light-chain-enhancer of activated B cells; TACI = Transmembrane activator and calcium modulating ligand interactor.

Example 3. Bioactivity Assessment of TACI Blockade of TACI-mediated stimulation by TACI-containing molecules.

[0489] The cell-line based bioassay described in Example 2 was used to assess the functional characterization of TACI- containing WT or vTD proteins for blockade of APRIL or BAFF-mediated ligand signaling via the TACI receptor in the Jurkat/NF- κ B/TACI cells. APRIL or BAFF-mediated ligand signaling was quantitated by monitoring luciferase production in the cells. Binding of a TACI-Fc fusion containing a vTD set forth in SEQ ID NO:26 was assessed (26 TACI CRD2-Fc). For comparison, WT TACI-Fc containing only the CRD2 domain of TACI (13 TACI CRD2-Fc) also was assessed.

[0490] As shown in **FIG. 3A**, an exemplary TACI vTD demonstrates increased inhibition of both human APRIL and BAFF. As shown in **FIG. 3B**, exemplary TACI vTD-Fc molecules

inhibit mouse APRIL and BAFF ligand signaling. Together, the results show the ability of TACI vTD molecules to block APRIL and BAFF TACI-mediated ligand signaling.

[0491] In another similar study, exemplary generated molecules as described in Example 1 were assessed for their ability to block APRIL or BAFF-mediated ligand signaling in Jurkat/NF- κ B/TACI cells. For comparison, control molecules were generated containing wild-type TACI ECD fused the Fc sequence set forth in SEQ ID NO: 73. In one control, the fusion protein contained WT TACI (TACI 30-110, SEQ ID NO:130; corresponding to the TACI ECD portion in atacicept, SEQ ID NO:132). In another control, the fusion protein contained WT TACI (TACI 13-118, SEQ ID NO:131), corresponding to the TACI ECD portion in telitacicept). Activity was compared to the control molecules. Activity also was compared to the anti-BAFF monoclonal antibody belimumab.

[0492] Exemplary TACI molecules, either WT or variant TACI vTDs, were titrated (between 100,000pM – 32pM), added to 2nM recombinant human APRIL or BAFF and assayed as described above for the Jurkat/NF- κ B assay. As shown in **FIG. 4**, the exemplary molecules containing TACI vTDs exhibited enhanced APRIL and BAFF blockade greater than TACI 30-100-Fc, TACI 13-118-Fc and belimumab. WT TACI-Fc containing only the CRD2 domain of TACI (13 TACI CRD2-Fc) also exhibited enhanced APRIL blockade greater than TACI 30-100-Fc and TACI 13-118-Fc.

[0493] These results are consistent with a finding that the minimal CRD2 domain (containing amino acids residues 68-110) exhibits improved blockade of APRIL compared to TACI ECD molecules also containing portions of the CRD1 domain as present in atacicept and telitacicept. **Table E1.B** provides the values for half maximal inhibitory concentration (IC₅₀) for inhibition of APRIL- and BAFF- mediated TACI signaling for the exemplary molecules described in **FIG. 4**. Also shown in parentheses is the relative blockage compared to atacicept (Δ atacicept) for each tested molecule.

Table E1.B. Bioactivity of TACI vTDs vs atacicept				
Description	SEQ ID NO	IC ₅₀ (nM) APRIL	IC ₅₀ (nM) APRIL (Δ TACI 30-110-Fc)	IC ₅₀ (nM) BAFF (Δ TACI 30-110-Fc)
26 TACI CRD2-Fc	26	179	179(0.05)	1216(0.21)
27 TACI CRD2-Fc	27	262	262(0.07)	1387(0.24)
29 TACI CRD2-Fc	29	339	339(0.09)	1336(0.23)
13 TACI CRD2-Fc	13	369	369(0.10)	1328(0.23)
TACI 13-118-Fc		9103	9103(2.37)	7699(1.33)

Belimumab		214911	214911(55.84)	2496(0.43)
TACI 30-110-Fc		3849	3849(1.00)	5771(1.00)

[0494] In another study, the bioactivity of vTD domain-containing molecule 26 TACI CRD2-Fc (containing a vTD TACI domain set forth in SEQ ID NO:26; Fc fusion SEQ ID NO: 167) were assessed in the cell line-based *in vitro* bioassay described in Example 2 in the presence of recombinant human or mouse APRIL and/or BAFF, either independently or in combination. Varying concentrations of TACI domain-containing molecules were incubated with 15 nM APRIL, 10 nM BAFF or APRIL+BAFF (15 nM APRIL+10 nM BAFF) in combination. Activity was compared to the control molecules. For comparison, WT TACI-Fc sequences corresponding to atacicept (containing a WT TACI 30-110 SEQ ID NO:132; SEQ ID NO:130) or Telitacicept/Tai'ai (RemeGen) were tested. As further controls, varying concentrations of anti-BAFF monoclonal antibody (mAb) containing sequences from belimumab (Benlysta) or anti-APRIL mAb BION-1301 (e.g. SEQ ID NO: 50 and 52 from U.S. Patent No. 10,377,830), each singly or together, also were incubated with APRIL, BAFF or BAFF+APRIL in combination.

[0495] As shown in **FIGS. 5A-5C and Table E1.C**, exemplary 26 TACI CRD2-Fc inhibited ligand signaling at levels equal to or greater than the Fc fusion proteins atacicept, telitacicept, as well as belimumab or BION-1301 individually or combined. The fusion protein containing 26 TACI CRD2-Fc neutralized the combined activity of BAFF and APRIL. These results support that the variant TACI-Fc, 26 TACI CRD2-Fc, neutralizes APRIL and BAFF activity more potently than WT TACI-Fc or combined anti-BAFF+APRIL mAbs in a cell-based reporter assay.

Table E1.C. IC50 values			
Test Articles	IC50 (pM)		
	BAFF	APRIL	BAFF + APRIL
26 TACI CRD2-Fc	1337	1758	1390
Belimumab	2263	--	>100,000
BION-1310	--	4901	>100,000
Belimumab + BION-1310	6848	2100	6805
Atacicept	8285	9258	7718
Telitacicept	6852	17244	16751

Example 4. Assessment of the Activity of TACI vTD-Fcs in an In Vivo Mouse Lupus Model.

[0496] This Example describes the assessment of exemplary TACI vTD-Fc molecules, to affect immune responses in an *in vivo* murine (NZB/NZW)F1 spontaneous lupus model. (NZBxNZW)F1 mice spontaneously develop an autoimmune disease very similar to human SLE and are regarded as one of the best mouse models of this disease. (NZB/NZW)F1 mice have high circulating concentrations of anti-dsDNA antibodies starting around 20 weeks of age, with the first clinical signs of disease detectable around 23 weeks of age. The mice develop hemolytic anemia, proteinuria, and progressive glomerulonephritis mediated by immune complex deposition in the glomerular basement membrane.

[0497] (NZB/NZW)F1 mice were dosed twice weekly via intraperitoneal (IP) injection with 14 mg/kg Fc control, or molar-matched amounts of TACI vTD-Fc (26 TACI CRD2-Fc) (17 mg/kg). Treatment started at group assignment (Week 22 of age) and continued through the end of the study. The study ended when mice reached Week 43 of age, though some animals were euthanized earlier in the study when they became moribund.

[0498] At various time points between 20 and 40 weeks of age, urine and serum samples were collected. Starting when mice were 20 weeks old, the concentration of protein in the urine from all mice on study was determined weekly with urinalysis test strips (Roche Chemstrip 2 GP, cat. 11895397160). Mean proteinuria scores over time in each treatment group are presented in **FIG. 6A**, and the mean percent change in body weight (weight loss is associated with advancing disease) in each group in plotted in **FIG. 6B**. The percent survival of mice in each treatment group is plotted in **FIG. 6C**. Anti-double stranded (ds) DNA IgG serum titers were measured by Hooke Laboratories, Inc. (Lawrence, MA) using their in-house kit, and the results are presented in **FIG. 6D**. Blood urea nitrogen (BUN) levels increase in these mice with advancing disease. BUN levels at termination of the study (or at sacrifice of mice that succumbed early) for each treatment group are shown in **FIG. 6E**. Statistical analysis was performed using Student's t-test; **** denotes $p < 0.0001$ and *** denotes $p = 0.0008$.

[0499] Kidneys were collected at termination from each mouse and analyzed histologically in replicate Periodic acid-Schiff (PAS)-stained sections using the criteria described in Alperovich G et al, 2007. Lupus 16:18-24. All kidney sections were analyzed blind, by a pathologist unaware of the treatments and clinical scores. Glomerular lesions (mesangial

expansion, endocapillary proliferation, glomerular deposits, and extracapillary proliferation) and tubular/interstitial lesions (interstitial infiltrates, tubular atrophy, and interstitial fibrosis) were analyzed and graded semi-quantitatively using a scoring system from 0 to 3, with 0=no changes, 1=mild changes, 2=moderate changes, and 3=severe changes. A total histological score for each mouse was calculated as the sum of the individual scores (maximum total score is 21). Kidney scores for total glomerular lesions, total tubular and interstitial lesions, and total kidney lesions are shown in **FIG. 6F**; as compared to Fc control treated mice, significantly improved renal histopathology was observed in animals treated with TACI vTD-Fc ($p<0.0001$ vs. Fc group).

[0500] For **FIG. 6G-6I**, the right kidney was collected from each mouse at study termination, weighed, dissected transversally, and frozen in a single optimal cutting temperature compound (OCT) block before sectioning and immunohistochemical (IHC) staining of mouse IgG and mouse complement C3 to assess glomerular IgG and C3 deposition, respectively. The kidney sections were permeabilized with acetone and stained with FITC-conjugated rat monoclonal anti-mouse complement component C3 (Cedarlane) diluted 1:25 in Primary Antibody Diluent (Leica Biosystems), or AF594-conjugated goat anti-mouse IgG (Thermo Fisher Scientific) diluted 1:200 in Primary Antibody Diluent. Glomerular depositions of IgG and C3 were analyzed by a pathologist using a semiquantitative scoring system from 0 to 4, with 0=no deposits, 1=mild mesangial deposition, 2=marked mesangial deposition, 3=mesangial and slight capillary deposition, and 4=intense mesangial and mesangiocapillary deposition, based on the method described in Kelkka et al. (2014) *Antioxid Redox Signal*. 21:2231-45. As compared to Fc control treated mice, significantly reduced glomerular IgG and C3 were observed in animals treated with 26 TACI CRD2-Fc ($p<0.0001$ vs. Fc control group for IgG, and $p=0.0005$ for C3); data were analyzed for statistically significant differences using Student's t-test. As compared to Fc control, 26 TACI CRD2-Fc also reduced sialadenitis (**FIG. 6J**; ($p<0.0001$ vs. Fc control group)).

[0501] Thus, together results showed that compared to Fc control, 26 TACI CRD2-Fc reduced anti-double-stranded (ds) DNA autoantibodies, sialadenitis, glomerulonephritis, BUN, proteinuria, and mortality.

[0502] Results demonstrate that the TACI vTD-Fc were able to significantly suppress proteinuria, preserve body weight, enhance overall survival, reduce anti-dsDNA autoantibodies and BUN, reduce IgG and C3 renal deposits, and prevent or improve kidney disease in the (NZB/NZW)F1 mouse model of SLE. Exemplary molecules were also capable of potentially

reducing B and T cell subsets including plasma cells, follicular T helper cells, germinal center cells, and memory T cells in the spleens and lymph nodes of these mice (data not shown).

Example 5: Assessment of Activity of TACI 13-118 -Fc with the addition of identified mutations

[0503] The impact of TACI mutations identified in Example 1 (see Table 1) were assessed to determine their ability to modulate the activity of Fc fusion proteins containing a longer TACI ECD sequence (containing both the CRD1 and CRD2 domain). In this example, the exemplary mutations K77E, F78Y and Y102D were introduced into the reference TACI ECD 13-118, which was fused to the exemplary Fc sequence set forth in SEQ ID NO:73. Activity was compared to a TACI vTD-Fc fusion protein containing only the CRD2 domain with the same mutations (set forth in SEQ ID NO:26), or to WT TACI (30-110, SEQ ID NO:130; corresponding to the TACI ECD portion in atacicept, SEQ ID NO:132), each also fused to the Fc sequence set forth in SEQ ID NO:73. The cell line-based bioassay described in Example 2 was used to assess blockade of APRIL or BAFF-mediated ligand signaling via the TACI receptor in the Jurkat/NF- κ B/TACI cells. APRIL or BAFF-mediated ligand signaling via the TACI receptor was quantitated by monitoring luciferase production in the cells.

[0504] As shown in **FIG. 7**, introduction of K77E, F78Y and Y102D mutations into TACI 13-118 ECD to generate variant (K77E/F78Y/T102D) TACI 13-118 improved APRIL and BAFF blockade (respectively) relative to the corresponding WT TACI 13-118ECD (diamonds) or the alternative ECD control WT TACI 30-110 (upward triangles). However, even with the incorporation of the mutations into TACI 13-118 ECD, the shorter variant TACI with the same mutations but containing only the CRD2 domain of TACI (vTD set forth in SEQ ID NO:26) exhibited the greatest APRIL and BAFF blockade in this assay (downward triangles). These results confirm that a minimal CRD2-containing domain confers improved activity to block APRIL and BAFF-mediated TACI signaling, however, the mutations K77E/F78Y/Y102D also further enhance APRIL and BAFF blockade by variant TACI ECDs incorporating the mutations.

[0505] **Table E2** provides the values for half maximal inhibitory concentration (IC₅₀) for inhibition of APRIL- and BAFF- mediated TACI signaling for the exemplary molecules described in **FIG. 7**. Also shown is a comparison to WT TACI-Fc controls (Δ atacicept) for each molecule.

Table E2. Bioactivity of Multi-Domain Immunomodulatory Proteins vs atacicept					
Description	SEQ ID NO	IC50 (nM) APRIL	IC50 (nM) APRIL (Δ TACI 30-110)	IC50 (nM) BAFF	IC50 (nM) BAFF (Δ TACI 30- 110)
26 TACI-Fc	26	214	214(0.05)	1268	1268(0.28)
TACI 13-118	131	7811	7811(1.81)	8452	8452(1.88)
TACI 13-118, with K77E/F78Y/Y102D		848	848(0.20)	2048	2048(0.46)
TACI 30-110		4317	4317(1.00)	4490	4490(1.00)

Example 6: Comparative Evaluation of TACI vTD-Fcs in an In Vivo KLH Immunization

Model

[0506] This Example describes the assessment of exemplary tested single domain Fc fusion proteins (described in **Example 1**) to affect immune responses to keyhole limpet hemocyanin (KLH) *in vivo* in mice. The mouse KLH immunization model can be used to evaluate the effects of the immunomodulatory molecules on antigen-specific responses to the T cell-dependent antigen KLH, following either one or two injections of KLH. Two injections of KLH, each separated by at least 7 days, provides a model that can evaluate both a primary immune response following the 1st KLH injection, and a secondary immune response in the period following the 2nd injection. This Example describes a study that evaluated the activity of multiple TACI single domain-containing molecules, such as soluble wild-type (WT) or variant TACI vTDs formatted as Fc fusions, in response to two injections of KLH without adjuvant (on Study Day 0 and Day 12). These test articles were compared to administration of molar-matched levels of an Fc isotype control protein. Activity of test articles observed in the mouse KLH model can often predict their immunomodulatory effects in humans.

[0507] To begin the KLH study, 10-week old female C57/BL6NJ mice (The Jackson Laboratories, Sacramento, CA) were randomized into 12 groups of 5 mice each. Mice were administered 0.25 mg KLH (EMD Millipore, Cat. 374825-25MG) via intraperitoneal (IP) injection on Days 0 and 12; the original commercial stock solution of KLH was diluted to the appropriate concentration with Dulbecco's phosphate-buffered saline (DPBS) prior to injection. Mice were dosed with the test articles as outlined in **Table E3** via IP injection (dosed on Days 4 and 11). The dose of test articles was molar matched to 15 mg/kg TACI-Fc. Six mice remained

untreated/uninjected as naïve controls (Group 13). Serum was collected on Day 5 (24 hr post-1st dose), Day 12 (24 hr post-2nd dose/pre-KLH boost), and Day 20 to evaluate drug exposure, ADA, and/or anti-KLH antibody levels. One animal in Group 10 received an incomplete dose of test article and was therefore removed from the study.

Table E3. Test Article Descriptions and Dose Regimen						
Group #	# of Mice	Test Article(s)	Dose Level (mg/dose)	(mg/kg)	Dose Schedule (D = Study Day)	Route of Delivery
1	5	Fc control	0.225	11.3	D4 and D11	IP
5	5	TACI 30-110 – Fc	0.306	15.3	D4 and D11	IP
6	5	TACI 13-118 – Fc	0.327	16.4	D4 and D11	IP
7	5	26 TACI CRD2-Fc	0.271	13.6	D4 and D11	IP
8	5	27 TACI CRD2-Fc	0.271	13.6	D4 and D11	IP
9	5	29 TACI CRD2-Fc	0.272	13.6	D4 and D11	IP
13	6	None (naïve)	N/A	N/A	N/A	N/A

N/A = not applicable

[0508] On Day 20, all mice were anesthetized with isoflurane and blood collected into serum separator tubes. Mice were sacrificed, and their spleens removed, weighed, and placed into DPBS on ice. Whole blood was centrifuged, and the serum removed and stored at -80°C until analyzed for anti-KLH levels by enzyme-linked immunosorbent assay (ELISA). Spleens were processed to single cell suspensions, the red blood cells (RBC) lysed using RBC Lysis Buffer (Biolegend, Cat. 420301) according to the manufacturer's instructions, and the cells counted in each sample using dual-fluorescence viability, using acridine orange/propidium iodide (AO/PI) staining (Nexcelom, Cat. CS2-0106-5mL).

[0509] Each spleen sample was then stained for flow cytometry analysis of immune cell subsets using the following method: 1×10^6 live cells were placed into a well of two 96-well plates (Corning, Cat. 3797; one plate for a B cell-specific panel and one for a T cell-specific panel), centrifuged at $1500 \times g$ for 10 seconds, the supernatant removed, and the cell pellet washed twice with DPBS. The pellets were resuspended in 100 μ L of live-dead stain (LIVE/DEAD Fixable Aqua Dead Cell Stain Kit, Life Technologies Corp., 1:1000 dilution in DPBS) and incubated for 10 min in the dark at room temperature. Following two washes with flow cytometry buffer (175 μ L each), tumor pellets were resuspended in Mouse BD Fc Block (diluted 1:50 with flow buffer), and incubated in the dark for an additional 5 min at RT. Without any additional washes, 50 μ L of a cocktail of the following flow cytometry antibodies (diluted in

flow cytometry buffer) were added to each well of cells for the B or T cell panels. For the B cell panel, the following antibodies were combined for the cocktail: anti-mouse CD19 BUV395 (clone 1D3, Becton-Dickinson; 1:100), anti-mouse CD138 BV421 (clone 281-2, BioLegend Inc.; 1:100, final concentration), anti-mouse CD3 ϵ BV510 (clone 17A2, BioLegend Inc.; 1:100, final concentration), anti-mouse IgD BV605 (clone 11-26c.2a, BioLegend Inc.; 1:100, final concentration), anti-mouse B220 BV785 (clone RA3-6B2, BioLegend Inc.; 1:100, final concentration), anti-mouse CD95 FITC (clone SA367H8, BioLegend Inc.; 1:100, final concentration), anti-mouse CD23 PerCP Cy5.5 (clone B3B4, BioLegend Inc.; 1:100, final concentration), anti-mouse GL7 PE (clone GL7, BioLegend Inc.; 1:100, final concentration), anti-mouse Gr1 PE Cy7 (clone RB6-8C5, BioLegend Inc.; 1:100, final concentration), anti-mouse CD21 APC (clone 7E9, BioLegend Inc.; 1:100, final concentration), and anti-mouse IgM APC Cy7 (clone RMM-1, BioLegend Inc.; 1:100, final concentration). For the T cell panel, the following antibodies were combined for the cocktail: anti-mouse PD-1 BV421 (clone 29F.1A12, BioLegend Inc.; 1:100, final concentration), anti-mouse CD11b BV510 (clone M1/70, BioLegend Inc.; 1:100, final concentration), anti-mouse CD3 ϵ BV605 (clone 145-2C11, BioLegend Inc.; 1:100, final concentration), anti-mouse CD8 BV785 (clone 53-6.7, BioLegend Inc.; 1:100, final concentration), anti-mouse CD44 FITC (clone IM7, BioLegend Inc.; 1:100, final concentration), anti-mouse CD4 PerCP Cy5.5 (clone GK1.5, BioLegend Inc.; 1:100, final concentration), anti-mouse CD62L PE (clone MEL-14, BioLegend Inc.; 1:100, final concentration), anti-mouse CXCR5 PE Dazzle (clone L138D7, BioLegend Inc.; 1:100, final concentration), anti-mouse CD25 PE Cy7 (clone PC61.5, BioLegend Inc.; 1:100, final concentration), and anti-mouse CD45 AF700 (clone 30-F11, BioLegend Inc.; 1:100, final concentration). The cells were incubated with one of the antibody cocktails in the dark, on ice, with gentle mixing for 45 min, followed by two washes with flow cytometry buffer (175 μ L per wash). Cell pellets were resuspended in 200 μ L flow cytometry buffer and collected on an LSRII flow cytometer. Data were analyzed using FlowJo software version 10.2 (FlowJo LLC, USA) and graphed using GraphPad Prism software (Version 8.1.2). Key cellular subset identification analysis included: total B cells (B220⁺ cells), marginal zone (MZ) B cells (B220⁺, CD19⁺, CD23⁻, CD21^{high}, IgM^{high} cells), germinal center (GC) B cells (B220⁺, CD19⁺, GL7⁺, CD95⁺ cells), T follicular helper (Tfh) cells (CD45⁺, CD3⁺, CD4⁺, PD-1⁺, CD185⁺ cells), CD4⁺ T effector memory (T_{em}) cells (CD45⁺, CD3⁺, CD4⁺, CD44⁺, CD62L⁻ cells), and CD8⁺ T_{em} cells (CD45⁺, CD3⁺, CD8⁺, CD44⁺, CD62L⁻ cells).

[0510] Statistically significant differences ($p < 0.05$) between groups were determined by one-way analysis of variance (ANOVA) and uncorrected Fisher's Least Significant Difference (LSD) multiple comparison test using GraphPad Prism software (Version 8.1.2).

[0511] To determine the extent to which the test articles inhibited KLH-mediated antibody immune responses compared to an Fc isotype control (SEQ ID NO:73), serum samples were evaluated for concentrations of anti-KLH antibodies in two ELISA assays. The ELISA assays measured either IgM- or IgG1-specific anti-KLH levels in the serum. Mouse serum samples at numerous dilutions were incubated in plates coated with KLH, followed by washes and detection with 1:2000 goat anti-mouse IgG1:HRP or 1:5000 goat anti-mouse IgM:HRP. Color development was achieved using a TMB Substrate Kit (SeraCare) and the ELISA plates analyzed on a plate reader (SpectraMax® iD3 Microplate Reader, Molecular Devices LLC). There was no standard curve for the assay, thus optical density (OD) was used to compare the levels of anti-KLH antibodies; the higher the OD, the greater the levels of anti-KLH antibodies in the serum sample. For anti-KLH IgM OD levels, data are presented in **FIG. 10A** (primary response), **FIG. 10B** (secondary response) and statistical analysis by 1-way ANOVA and uncorrected Fisher's LSD multiple comparison test presented in **Table E4** and **Table E5**, respectively. Anti-KLH IgG1 OD levels are presented in **FIG. 10C** (primary response), **FIG. 10D** (secondary response) and statistical analysis by 1-way ANOVA and uncorrected Fisher's LSD multiple comparison test presented in **Table E6** and **Table E7**. Results demonstrate that each of the test articles were able to significantly reduce anti-KLH IgM levels in serum during the primary immune response compared to Fc control treatment, with 29 TACI-CRD2-Fc(SEQ ID NO: 29) demonstrating the largest reductions amongst all test articles, and TACI 30-110-Fc and TACI 13-118-Fc treatment having the most modest effect (**FIG. 10A**). For the secondary response on Day 20, measured 9 days after the 2nd and last dose of test article, all test articles except TACI 13-118-Fc induced significant reductions in anti-KLH IgM levels, with all test articles except TACI 30-110-Fc, TACI 13-118-Fc demonstrating reduction (**FIG. 10B**). Each of the test articles were also able to significantly reduce anti-KLH IgG1 levels during the primary immune response compared to Fc control, with all test articles except TACI 30-110-Fc, TACI 13-118-Fc again demonstrating the greatest reductions (**FIG. 10C**). For the secondary response to KLH, all test articles except TACI 30-110-Fc, TACI 13-118-Fc, significantly reduced levels of anti KLH IgG1 (**FIG. 10D**). These results indicate that most of the molecules containing the TACI vTD were efficacious at reducing the T cell-dependent antibody immune response to

KLH, with 26 TACI CRD2-Fc, 27 TACI CRD2-Fc, and 29 TACI CRD2-Fc, exhibiting the most significant effects in this mouse immunization model.

Table E4. Statistical Analysis of anti-KLH IgM OD levels (primary response; FIG. 10A)		
Comparison	p-value	Significant?
Fc Control vs. TACI 30-110 – Fc	<0.0001	Yes
Fc Control vs. TACI 13-118 – Fc	<0.0001	Yes
Fc Control vs. 26 TACI CRD2-Fc	<0.0001	Yes
Fc Control vs. 27 TACI CRD2-Fc	<0.0001	Yes
Fc Control vs. 29 TACI CRD2-Fc	<0.0001	Yes
Fc Control vs. Naive	<0.0001	Yes

Table E5. Statistical Analysis of anti-KLH IgM OD levels (secondary response; FIG. 10B)		
Comparison	p-value	Significant?
Fc Control vs. TACI 30-110 – Fc	0.0283	Yes
Fc Control vs. TACI 13-118 – Fc	0.4653	No
Fc Control vs. 26 TACI CRD2-Fc	<0.0001	Yes
Fc Control vs. 27 TACI CRD2-Fc	<0.0001	Yes
Fc Control vs. 29 TACI CRD2-Fc	<0.0001	Yes
Fc Control vs. Naive	<0.0001	Yes

Table E6. Statistical Analysis of anti-KLH IgG1 OD levels (primary response; FIG. 10C)		
Comparison	p-value	Significant?
Fc Control vs. TACI 30-110 – Fc	0.0218	Yes
Fc Control vs. TACI 13-118 – Fc	0.0093	Yes
Fc Control vs. 26 TACI CRD2-Fc	0.0012	Yes

Table E7. Statistical Analysis of anti-KLH IgG1 OD levels (secondary response; FIG. 10D)		
Comparison	p-value	Significant?
Fc Control vs. 27 TACI CRD2-Fc	<0.0001	Yes
Fc Control vs. 29 TACI CRD2-Fc	<0.0001	Yes
Fc Control vs. Naive	<0.0001	Yes

[0512] As shown in **FIG. 11A and 11B**, mice treated with all test articles except TACI 30-110-Fc or TACI 13-118-Fc had significantly smaller spleens as assessed by weight and cell number, respectively, at the end of the study (Day 20) compared to Fc control-treated mice (**Table E8**). Mice treated with each of the test articles also had significantly fewer spleen cells than the Fc control group. The smaller spleens are indicative of reductions in lymphocytes, which can have immunomodulatory effects on the pathogenesis of autoimmune and inflammatory diseases associated with heightened immune responses, particularly those driven by B and/or T cells. Statistical analyses of spleen weights and total cell numbers are shown in **Table E8** and **Table E9**, respectively.

Table E8. Statistical Comparisons Across All Treatment Groups for Spleen Weights (FIG. 11A):						
Treatment Group	Fc control	TACI 30-110 – Fc	TACI 13-118 – Fc	541 TACI CRD2-Fc	27 TACI CRD2-Fc	29 TACI CRD2-Fc

[0513] Of particular importance to the pathogenesis of autoimmune and inflammatory diseases are cell types that promote B cell survival and differentiation, antibody production, and T cell effector memory. These cell types include, but are not limited to, the following: total B cells, marginal zone (MZ) B cells, germinal center (GC) B cells, T follicular helper (Tfh) cells, and CD4⁺ and CD8⁺ T effector memory (T_{em}) cells. Therapeutics whose mechanisms of action include reducing these cell types would be anticipated to be efficacious in the treatment of numerous autoantibody-mediated diseases. Treatment with any of the TACI vTD-Fc test articles substantially reduced the numbers of multiple splenic B cell subsets compared to the remaining treatment groups, including impacts on transitional-2 (B220⁺ CD19⁺ CD23⁺ CD21^{high} IgM^{high}), follicular (B220⁺ CD19⁺ CD23⁺ CD21⁺ IgM⁺), marginal zone (B220⁺ CD19⁺ CD23^{neg} CD21^{high} IgM^{high}), germinal centre (B220⁺ CD19⁺ GL7⁺ CD95⁺), and plasma cells (B220^{low} CD19⁺ CD138^{high}) (**FIG. 12** and **FIG 13**). These TACI vTD- molecules were as effective or better than the two WT TACI -Fc molecules (TACI 13-188-Fc and TACI 30-110-Fc) in their ability to reduce the percentage (not shown) or numbers of these populations that are important in B cell survival and differentiation and antibody production. Statistical analyses from flow cytometry data of Day 20 splenocytes are shown in **Tables E10-E28**.

[0514] The splenic CD3⁺, CD4⁺, or CD8⁺ T cell populations were largely unaffected by the 6 TACI vTD- -containing test articles. compared to the Fc control group (**FIG. 14A-C**), and T_{cm} and T_{em} memory T cells compared to the Fc control group, were unaffected (**FIG. 15**). As compared to the Fc control, all of the test articles reduced the numbers of follicular helper T cells (CD45⁺, CD3⁺, CD4⁺, PD-1⁺, CD185⁺), which interact with B cells in the germinal center and are important contributors to T cell-dependent antibody responses (**FIG. 14D**).

Table E10. Statistical Analysis of Splenic B Cell Subsets—Cell Numbers vs. Fc Control Group (FIG. 12)

[0515] Together, these results indicate that TACI vTD- containing single domain Fc fusion molecules, that inhibit B and/or T cell activity can reduce immune responses and cell subset changes mediated by the T cell-dependent antigen KLH *in vivo* (i.e. anti-KLH levels in serum and changes in immune cell subsets). These results are consistent with the evaluation of the single TACI domain B cell inhibitory molecules, as clinical therapeutics in the treatment of autoimmune and inflammatory diseases in which hyperactive lymphocytes play a role.

Example 7. Bioactivity Assessment of TACI Blockade of TACI-mediated stimulation by TACI-containing molecules

[0516] Additional TACI vTD were generated containing one or more mutations present in exemplary TACI vTDs set forth in SEQ ID NO:26 (K77E, F78Y, Y102D), SEQ ID NO:27 (Q75E, R84Q) or SEQ ID NO: 29 (K77E, A101D, Y102D). Single, double, and triple mutations containing combinations of mutations from Q75E, K77E, F78Y, R84Q, A101D and Y102D were generated. The resulting TACI vTDs were further formatted as a TACI vTD-Fc fusion protein with an Fc domain. The exemplary generated Fc fusion proteins were generated substantially as described in Example 1. Briefly, to generate recombinant immunomodulatory proteins as Fc fusion proteins, the encoding DNA was generated to encode a protein as follows: variant TACI domain followed by a linker of 7 amino acids (GSGGGGS; SEQ ID NO: 74) followed by a human IgG1 effectorless Fc sequence containing the mutations L234A, L235E and G237A, by the Eu Index numbering system for immunoglobulin proteins (SEQ ID NO:73). For comparison, the following molecules also were tested: (1) WT TACI (68-110)-Fc (TACI 68-110, SEQ ID NO: 13, TACI-Fc SEQ ID NO: 171); and (2) a TACI-Fc with exemplary mutations K77E, F78Y and Y102D introduced into the reference TACI ECD 13-118, which was fused to the exemplary Fc sequence set forth in SEQ ID NO:73; see Example 5. Additional controls included: (3) WT TACI (13-118)-Fc (TACI 13-118, SEQ ID NO:131; corresponding to the TACI ECD portion in telitacept); (4) WT TACI (30-110)-Fc (TACI 30-110, SEQ ID NO:130; corresponding to the TACI ECD portion in atacicept, SEQ ID NO:132); (5) BAFF-R ECD and (6) belimumab.

[0517] The generated molecules were assessed for blockade of APRIL or BAFF-mediated ligand signaling via the TACI receptor in Jurkat/NF- κ B/TACI cells substantially as described in Example 2. Exemplary TACI vTD-Fc molecules were titrated from 100,000 – 6 pM and mixed with 30nM human APRIL or 10nM human BAFF, 30 minutes prior to addition of Jurkat/NF- κ B/TACI cells. APRIL or BAFF-mediated ligand signaling was quantitated by monitoring luciferase production in the cells.

[0518] The results are summarized as the half maximal inhibitory concentration (IC₅₀) of exemplary tested molecules in Table E29. The percent change in IC₅₀ compared to the reference control WT TACI (68-110)-Fc (TACI 68-110, SEQ ID NO: 13, TACI-Fc SEQ ID NO: 171) is indicated in parentheses (Δ WT). Similar to results depicted above, the wild-type minimal CRD2 WT TACI (68-110)-Fc exhibited superior blockade of APRIL and BAFF compared to other tested control molecules, including those with sequences similar to telitacept and atacicept. As

indicated, certain mutations and combinations of mutations were associated with a further substantial increase in the ability to block APRIL or BAFF mediated ligand signaling. Together, the results show the ability of TACI vTD molecules to block APRIL and BAFF TACI-mediated ligand signaling.

Table E29. Exemplary TACI vTD-Fc

Example 8. Evaluation in Sjogren's syndrome model in non-obese diabetic mice

[0519] This Example describes the assessment of exemplary single domain 26-TACI-vTD Fc fusion proteins (TACI vTD SEQ ID NO:26; Fc fusion SEQ ID NO: 167 in an *in vivo* short-term model of Sjogren's syndrome in NOD mice, including assessment of sialadenitis, serum levels of test molecules and insulinitis.

[0520] The Sjogren's syndrome model was induced in female diabetes-prone NOD/ShiLtJ mice (about 6 weeks of age) by repeat dosing of an anti-mPD-L1 antibody. Specifically, 0.1 mg of anti-mPD-L1 antibody was administered by intraperitoneal injection on days 0, 2, 4, and 6. Test molecule fusion proteins were dosed on days 0, 2 and 4 according to Table E30 below.

Table E30. Treatment Groups and Dosing Regimens					
Group	N	Anti-mPD-L1 Treatment (IP)	Test Article (TA)	TA Dose Level (IP)	mAb Treatment and TA dosing Days
1	15	0.1 mg	Fc control	0.28 mg	0, 2, 4, 6 and 0,2 4
3	15	0.1 mg	26-TACI-CRD2 Fc	0.34 mg	0, 2, 4, 6 and 0,2 4
6 (naïve)	5	0	n/a	0	n/a

Abbreviations: IP= intraperitoneal(ly); mg= milligram; n/a = not applicable

[0521] Blood was obtained from the tail vein of mice (2-5 µL) on days 7, 8, 9, and 10, placed on a ReliOn Prime glucose test strip, and blood glucose (mg/dL) was measured using the ReliOn Prime Glucose Test System. At Day 10 of the experiment, mice were sacrificed and serum, submandibular glands (SMG), and pancreas were collected and analyzed.

[0522] The left SMG and pancreas were removed, dissected away from adjacent lymph nodes, and placed into neutral-buffered formalin (NBF) for approximately 72 hours, followed by transfer to 70% ethanol. The fixed tissues were embedded in paraffin, sectioned, and stained on glass slides with hematoxylin and eosin (H&E).

[0523] The scoring systems used to evaluate the extent of sialadenitis was scored as per Nandula et al. 2011 (Table 6 therein; reproduced as Table E31), and insulinitis per Gutierrez et al 2014 (Table 7 therein; reproduced as Table E32).

Table E31.Histological Scoring Used to Evaluate Sialadenitis	
Score	Criteria
0	No inflammatory foci
1	1-5 foci of >50 inflammatory cells
2	>5 foci without parenchymal destruction
3	Moderate parenchymal destruction
4	Extensive parenchymal destruction

Table E32.Histological Scoring Used to Evaluate Insulitis	
Score	Criteria
0	No insulitis
1	Peri-islet insulitis
2	Intermediate insulitis
3	Intra-islet insulitis
4	Complete islet insulitis

[0524] Statistically significant differences between groups for histology scores were determined using Student's t-test. GraphPad PRISM® software (Version 8.1.2) was used for statistical analyses and *p* values < 0.05 were considered statistically significant for all statistical tests.

[0525] Treatment with the exemplary 26-TACI-CRD2 Fc fusion protein reduced incidence of sialadenitis (**FIG. 16A**) and resulted in a significantly lower histology score (*p*<0.01) than the mean scores for Fc control (**FIG. 16B**). These results are consistent with a finding that treatment of anti-PD-L1 injected NOD mice with the tested molecules reduced both the incidence and severity of sialadenitis in this model of Sjogren's syndrome.

[0526] The overall incidence of insulitis in these diabetes-prone mice and the degree of insulitis after treatment with the tested molecules is shown in **FIG. 17A** and **FIG. 17B**. 26-TACI-CRD2 Fc fusion proteins significantly reduced the degree of insulitis, as assessed by histological analysis (**FIG. 17B**).

[0527] Together, these results indicate treatment with the tested exemplary TACI-Fc molecule reduced the incidence and severity of sialadenitis in this mouse model of Sjogren's

syndrome. These results indicate the potential for TACI molecules in therapeutic use for treating Sjogren's syndrome, and for TACI-CTLA-4 multi-domain stack molecules as therapeutics to impact the onset of type 1 diabetes in humans.

Example 9. Assessment of Exemplary Monomeric and Tetrameric Constructs.

[0528] Additional TACI-Fc fusion proteins were generated containing one (monomeric) or four (tetrameric barbell and tetrameric tandem) TACI vTD domains using the WT TACI of different lengths: 68-110 (set forth in SEQ ID NO:13), 29-110 (set forth in SEQ ID NO: 1) or 13-118 (set forth in SEQ ID NO: 131), and the TACI vTD set forth in SEQ ID NO:26 (K77E, F78Y, Y102D). The monomeric and tetrameric TACI WT and TACI vTD were formatted as TACI WT and TACI vTD-Fc fusion proteins with an Fc domain. The exemplary generated Fc fusion proteins were generated substantially as described in Example 1 and are described in **Tables E33A-E33C**.

[0529] Briefly, to generate recombinant monomeric immunomodulatory proteins as single chain Fc fusion proteins, the encoding DNA was generated to encode a protein as follows: WT TACI or variant TACI domain followed by a linker of 12 amino acids (GSGGGGSGGGGS; SEQ ID NO: 194) followed by a single chain Fc (scFc) set forth in SEQ ID NO: 218 (composed of a human IgG1 effectorless Fc sequence containing the mutations L234A, L235E and G237A, by the Eu Index numbering system for immunoglobulin proteins (SEQ ID NO:73), followed by a (GGGGS)₁₃ linker (SEQ ID NO:195) followed by a second human IgG1 effectorless Fc sequence containing the mutations L234A, L235E and G237A, by the Eu Index numbering system for immunoglobulin proteins). The long linker, e.g. set forth in SEQ ID NO:195, connects the C-terminus of the first Fc unity to the N-terminus of the second Fc unit forming the scFc. The generated molecules are summarized in **Table E33A**.

TABLE E33A. Exemplary Monomeric Immunomodulatory Proteins					
AA SEQ ID NO	NT SEQ ID NO	DESCRIPTION	TACI SEQ ID NO	LINKER SEQ ID NO	FC SEQ ID NO

-----	-----	--	-----	-----	-----

[0530] To generate recombinant tetrameric immunomodulatory proteins as Fc fusion proteins, proteins were generated in different formats as follows:

[0531] In one format, the encoding DNA was generated to encode three different protein versions as follows: WT TACI (SEQ ID NO:198): WT TACI domain SEQ ID NO:13 followed by a linker of (G4S)4 SEQ ID NO: 84; followed by a WT TACI domain SEQ ID NO: 13; followed by a linker of GSGGGGS SEQ ID NO: 74; followed by a human IgG1 effectorless Fc sequence containing the mutations L234A, L235E and G237A, by the Eu Index numbering system for immunoglobulin proteins (SEQ ID NO:73).

[0532] In one format, the encoding DNA was generated to encode three different protein versions as follows: WT TACI (SEQ ID NO:202) : WT TACI domain SEQ ID NO:13 followed by a linker of GSGGGGS SEQ ID NO: 74; followed by a human IgG1 effectorless Fc sequence containing the mutations L234A, L235E and G237A, by the Eu Index numbering system for immunoglobulin proteins (SEQ ID NO:73) followed by a linker of (G4S)4 SEQ ID NO: 84 followed by WT TACI domain SEQ ID NO:13.

[0533] In one format, the encoding DNA was generated to encode three different protein versions as follows: TACI vTD Barbell (SEQ ID NO:201): TACI vTD set forth in SEQ ID NO:26 followed by a linker of GSGGGGS SEQ ID NO: 74; followed by a human IgG1 effectorless Fc sequence containing the mutations L234A, L235E and G237A, by the Eu Index numbering system for immunoglobulin proteins (SEQ ID NO:73) followed by a linker of (G4S)4 SEQ ID NO: 84 followed by TACI vTD set forth in SEQ ID NO:26.

A. Bioactivity of Exemplary Multi-Domain Molecules

[0534] In one experiment, exemplary molecules set forth in Tables E33A-C were assessed using the Jurkat /NF- κ B/TACI reporter cells for blockade of APRIL- or BAFF-mediated signaling, substantially as described in Example 1. Activity was assessed for inhibition of the soluble BAFF (3-mer) or for inhibition of an oligomer of twenty BAFF 3-mers (BAFF 60-mer). **Table E34** provides the values for half maximal inhibitory concentration (IC₅₀) for inhibition of APRIL- and BAFF- mediated TACI signaling. In some instances, the proteins tested were not compared to their parental of WT controls and appear as (-) in the Table below. The results in **Table E34** demonstrate that all generated formats block BAFF and APRIL binding.

TABLE E34. Assessment of Exemplary Monomeric and Tetrameric Immunomodulatory Proteins				
SEQ ID NO	Description	APRIL IC ₅₀ (pM)	BAFF IC ₅₀ (pM)	BAFF 60-mer IC ₅₀ (pM)

Example 10. Evaluation of Exemplary TACI vTD-Fcs in a Pharmacokinetic/Pharmacodynamic Study Following a Single Intravenous Infusion in Male Sprague Dawley Rats.

[0535] The Example describes the tolerability, pharmacokinetics, and pharmacodynamics of the exemplary variant fusion protein 26 TACI CRD2-Fc, generated in either a HEK-293 cell line (26 TACI CRD2-Fc (HEK-293)), or generated in a CHOZN cell line (26 TACI CRD2-Fc (CHOZN)), when administered by a single intravenous infusion to male Sprague Dawley rats.

[0536] Exemplary variant fusion proteins 26 TACI CRD2-Fc (HEK-293) and 26 TACI vTD-Fc (CHOZN), were administered to 3 male rats per group via intravenous bolus injection at 20 mg/kg once on Day 1. Dose formulations were prepared based on the analytical results from preparations used for dosing.

[0537] Endpoints assessed included clinical observations, food consumption, body weight, and serum immunoglobulins. Blood was collected at multiple time-points to characterize 26 TACI CRD2-Fc (HEK-293) and 26 TACI CRD2-Fc (CHOZN), and analyzed as serum concentrations over time. The in-life portion of this study was completed on Day 22.

[0538] Except for one animal administered 26 TACI CRD2-Fc (CHOZN), the T_{max} for both test articles was observed at 0.083 hours post-dose. Exposure, based on mean C_{max} and AUC_{0-t} , was also similar between the two test articles. The $t_{1/2}$ was consistent in two animals per group (range = 3.66 to 4.89 days) but variable in the third 26 TACI CRD2-Fc (HEK-293); 10.3 days, 26 TACI CRD2-Fc (CHOZN)-1.57 days). No differences in clinical observations, changes in food consumption, or changes in body weights were observed over the course of this study for 26 TACI CRD2-Fc (HEK-293) compared to 26 TACI CRD2-Fc (CHOZN) (data not shown). The test articles were administered via a bolus (rather than slow infusion) intravenous injection, a method that may account for the observed inter-animal variability.

[0539] Serum immunoglobulin (IgM, IgA, and IgG) concentrations declined an average of 86%, 66%, and 45% from baseline at Day 22, respectively, for 26 TACI CRD2-Fc (HEK-293), and dropped an average of 77%, 40%, and 25% from baseline, respectively, for 26 TACI CRD2-Fc (CHOZN) (**FIG. 18** and **FIG. 19**). Mean C_{max} was 231 and 249 $\mu\text{g/mL}$, and mean AUC_{0-t} was 473 and 554 $\text{day} \cdot \mu\text{g/mL}$ for 26 TACI CRD2-Fc (HEK-293) and (CHOZN), respectively.

[0540] In conclusion, 20 mg/kg 26 TACI CRD2-Fc (HEK-293) or 26 TACI CRD2-Fc (CHOZN), administered via a single intravenous bolus injection to rats resulted in good tolerability, and similar PK profiles and decreases in serum immunoglobulin levels. These

results are consistent with a finding that production of the TACI-Fc fusion protein in either mammalian HEK-293 or CHO cells results in similar pharmacokinetics/pharmacodynamics.

Example 11. Comparison of Exemplary TACI vTD-Fcs to WT TACI-Fc proteins in a Pharmacokinetic/Pharmacodynamic Study Following a Single Intravenous Infusion in Female Cynomolgus Monkeys.

[0541] This Example describes the evaluation of the pharmacokinetics and pharmacodynamics of 4 exemplary variant TACI-Fc fusion proteins when administered by a single intravenous infusion over a 30-minute period to cynomolgus monkeys. The variant TACI-Fc fusion proteins in this example were generated by expression in CHOZN cells.

[0542] Female cynomolgus monkeys (2/group) were administered a single intravenous (IV) infusion over 30-minutes (± 3 minutes) of vehicle buffer (25 mM Tris, 161 mM Arginine, pH 7.5) (0 mg/kg), or 9 mg/kg 26 TACI CRD2-Fc (SEQ ID NO:167), 26 TACI CRD2-Fc 81 (SEQ ID NO:168), TACI 13-118 -Fc (corresponding to the TACI ECD portion in telitacicept set forth in SEQ ID NO:131 with effectorless IgG1 Fc; SEQ ID NO:241) or TACI 13-118 -Fc 81 (TACI 13-118 set forth in SEQ ID NO:131 with wildtype IgG1 Fc; SEQ ID NO:240) as outlined in **Table E35A** below. As another comparator, results were compared to atacicept administered intravenously at 1 mg/kg from published data (Carbonatto et al. (2008) Toxicol. Sci. 105:200-210). Dose formulations were administered using a temporary catheter inserted into a peripheral vein connected to an infusion line. The appropriate volume was delivered using an infusion pump.

5	2	TACI 13-118 - Fc 81	9	2.5	IV

Pharmacokinetic Analyses

[0543] Serum PK data were imported into Phoenix WinNonlin v8.3 (Certara, Princeton, NJ) for analysis. A standard non-compartmental model with IV infusion dosing was used to estimate the individual animal PK parameters. Nominal sample collection times relative to the start of infusion were used for the calculations. AUC values were estimated using the linear up/log down trapezoidal method.

Serum PK

[0544] Individual animal serum concentration versus time profiles (mean+range) for each of the test articles are shown in **FIG. 20**. The levels of serum IgM, IgA, and IgG in animals receiving 26 TACI CRD2-Fc or 26 TACI CRD2-Fc 81 decreased an average of approximately 60%, 50%, and 30% of baseline at their nadir on Day 27, respectively (**FIG. 21**). Similar results were observed whether the fusion construct included the effectorless Fc (SEQ ID NO: 73) or the wild-type Fc (SEQ ID NO: 81). FIG. 20B show results as further compared to Atacicept. The results in FIG. 20B are summarized in Table E35B.

Table E35B		
	C _{max} /Dose (µg/mL per mg/kg)	AUC/Dose (µg*hr/mL per mg/kg)
26 TACI CRD2-Fc	27	1167
TACI 13-118-Fc	25	397
Atacicept	23	215

[0545] Following a single 9 mg/kg IV dose of 26 TACI CRD2-Fc, serum concentrations were measurable out to 34 or 26 days post-dose in the two dosed animals, respectively (LLOQ = 19.5 ng/mL). Following a single 9 mg/kg IV dose of 26 TACI CRD2-Fc 81, serum concentrations were measurable out to 34 or 26 days post-dose in the two dosed animals, respectively (LLOQ = 39 ng/mL). Following a single 9 mg/kg IV dose of 26 TACI CRD2-Fc, serum concentrations were measurable out to 26 or 20 days post-dose in the two dosed animals, respectively (LLOQ = 156 ng/mL). Following a single 9 mg/kg IV dose of TACI 13-118 Fc 81, serum concentrations were measurable out to 13 days post-dose in both dosed animals (LLOQ = 156 ng/mL).

[0546] Immunophenotyping of whole blood throughout the study indicated that multiple changes were observed in lymphocyte populations following test article administration in Groups 2-5, as compared to baseline values (average of Days -8 and -3). **FIG. 22** depicts absolute cell counts and **FIG. 23** depicts % of cells from baseline. Despite typical inter-animal variability in absolute cell counts, there were clear reductions as compared to baseline in various B cell subsets in animals treated with 26 TACI CRD2-Fc, 26 TACI CRD2-Fc 81, TACI 13-118 - Fc or TACI 13-118 - Fc 81 (**FIG. 22 and FIG. 23**). Specifically, decreases in absolute B cell counts and % change from baseline were observed within the memory B cells (CD3-CD20+CD21+CD27+), with nadirs on Day 27 followed by a slight upward trend on Days 35 and 42 (right panels of **FIG. 22 and 23**). Test article-related alterations in other B cell subsets evaluated, including naïve (CD3-CD20+CD21+CD27-) B cells were not as apparent, attributable possibly to the small group sizes and inter-animal variability.

[0547] Slight decreases in total T cells (CD3+CD20-) and resting T cells (CD3+Ki67-), were observed on Days 20 and 27 in all four test article-treated groups. No test article-related impact on absolute counts or relative percentages of the relatively infrequent proliferating T cells (CD3+Ki67+) was observed (**FIG. 24**).

[0548] Table E36 depicts pharmacokinetic (PK) parameters following dosing. Following IV dosing, the $T_{\max}$ for all test articles was observed at 0.0236 days post-start of infusion (i.e., 0.083 hr after the end of infusion, the first measured timepoint). Exposure based on mean $C_{\max}$ was similar (within 25%) between all four test articles. However, exposure based on AUC_{0-t} was approximately 3 to 4 times higher after 26 TACI CRD2-Fc and 26 TACI CRD2-Fc 81 dosing compared to the TACI 13-118 - Fc or TACI 13-118 - Fc 81 test articles. This difference in exposure corresponded to a lower CL and V_{ss} in the 26 TACI CRD2-Fc and 26 TACI CRD2-Fc 81 groups compared to the TACI 13-118 - Fc or TACI 13-118 - Fc 81 groups (Table 3). TACI 13-118 - Fc appeared to have the longest $t_{1/2}$ (mean $t_{1/2}$ = 5.14 days compared to 2.57 to 3.47 in the other dose groups).

[0549] Anti-drug antibodies (ADA) may have affected the PK profile of 26 TACI CRD2-Fc 81, as both animals that received this test article developed relatively high titers ($\geq 1:1000$) by Day 26. Animals from all the other dose groups were either negative for ADA, or had relatively low titers (titer = 1:100).

[0550] In summary, single administration of 26 TACI CRD2-Fc , 26 TACI CRD2-Fc 81, TACI 13-118 - Fc or TACI 13-118 -Fc 81 via 30-minute intravenous infusion to female cynomolgus monkey at 9 mg/kg resulted in higher exposure of 26 TACI CRD2-Fc and 26 TACI CRD2-Fc 81, when compared with the TACI 13-118 - Fc or TACI 13-118 -Fc 81 groups. Test article-related decreases in serum IgM, IgA, and IgG concentrations were most dramatic in the animals dosed with 26 TACI CRD2-Fc or 26 TACI CRD2-Fc 81, reaching their nadir between Day 21 and Day 27. Decreases in absolute counts and percent change from baseline of CD20+CD21+ B cell populations were observed in animals treated with the test articles, with the lowest levels observed at Day 27 in the animals treated with 26 TACI CRD2-Fc or 26 TACI CRD2-Fc 81. Thus, both 26 TACI CRD2-Fc and 26 TACI CRD2-Fc 81 exhibited higher overall exposures and more potent reductions in serum IgM, IgA, and IgG than either TACI 13-118 - Fc or TACI 13-118 -Fc 81. These findings are consistent with the mechanism of action and relative in vitro potency of the four TACI-Fc test articles. The results further support that the 26 TACI CRD2 -Fc fusion proteins demonstrate favorable characteristics, including higher serum exposure and more potent immunosuppressive activities, even as compared to the WT TACI-Fc fusion proteins. These results may support lower clinical doses and/or longer dosing intervals than WT TACI-Fc therapeutics, including for the treatment of multiple autoimmune and inflammatory diseases, particularly B cell-related diseases such as systemic lupus erythematosus (SLE), Sjogren's syndrome (SjS), and other connective tissue diseases.

Example 12. Clinical Dose Selection and Pharmacokinetic Modeling

[0551] This Example describes the selection of a clinical dose and pharmacokinetic modeling of the exemplary test article 26 TACI CRD2-Fc .

[0552] Human pharmacokinetic (PK) was predicted based on the PK data from the cynomolgus monkey study described in Example 11, and allometric scaling method. A linear PK at different dose levels was assumed to predict human exposure. The clinical dose levels were selected based on predicted human PK and in vitro inhibition constant (IC) values from BAFF blockade in the Jurkat/NF- κ B/TACI assay described in Example 2.

PK modeling

[0553] A two-compartment PK model was used to fit the observed PK data in the cynomolgus monkey study described in Example 11. The human PK parameters were predicted using the allometric scaling based on body weight and PK parameters estimated in monkeys. **FIG. 25A-25B** depict the predicted human PK profiles after repeated IV dosing every four weeks (**FIG. 25A**) or every two weeks (**FIG. 25B**). The lowest clinical dose (8 mg) was determined based on the predicted trough serum concentration, and resulted in greater than the IC₁₀ value (0.0087 μ g/mL) and less than IC₅₀ value (0.078 μ g/mL) following every four weeks of intravenous dosing (**FIG. 25A**), or greater than the IC₅₀ value (0.078 μ g/mL) and less than IC₉₀ value (0.705 μ g/mL) following every two weeks of intravenous dosing (**FIG. 25B**).

Example 13. Administration of TACI CRD2-Fc in Healthy Subjects

[0554] Healthy adult subjects are administered a single dose of the exemplary TACI CRD2-Fc, 26 TACI CRD2-Fc (set forth in SEQ ID NO: 167). Safety, tolerability, pharmacokinetics (PK), and pharmacodynamics (PD) of the fusion protein are assessed. The TACI CRD2-Fc product is provided as a 100 mg/mL liquid formulation with the following excipients: acetate, proline and polysorbate 80. The TACI CRD2-Fc is provided as a single-use 2 mL glass vial with extractable volume of about 0.8 mL (80 mg). Before use, the TACI CRD2-Fc product is stored at -20 °C, protected from light.

[0555] Sixty-six healthy subjects (ages 18-65 years) are divided into 7 intravenous (IV) cohorts and 4 subcutaneous (SC) cohorts with 6 participants per cohort. The dosing protocol is based on the predicted human PK of 26 TACI CRD2-Fc using PK modeling and allometric scaling from PK data in cynomolgus monkeys, and a safety margin for the predicted human exposure based on the no-observed-adverse-effect level (NOAEL) toxicology studies in rats and monkeys, as described in Example 11 and 12.

[0556] For each IV cohort, the subjects are randomized 1:1 to receive a single IV dose (2.4 mg) of 26 TACI CRD2-Fc or placebo (normal saline, 0.9% w/v NaCl as a sterile solution) on Day 1. The planned starting dose of 2.4 mg IV is the minimum anticipated biological effect level (MABEL) based on the potential for hypercytokinemia as assessed in an in vitro cytokine release assay for TNFalpha. After approximately 24 hours of observation from the end of dosing, the remaining 4 participants in the IV cohort are randomized 3:1 to receive 26 TACI CRD2-Fc or placebo, respectively. After the last subject is dosed in the IV cohort at the first dose level, escalation to the next dose level proceeds following review of safety data. Subjects in the IV cohort are administered a single intravenous infusion over approximately 30 minutes of one of the following doses levels: 2.4 mg, 8 mg, 24 mg, 80 mg, 240 mg, 480 mg, and 960 mg. The starting dose of 2.4 mg IV is 1,780-fold and 923-fold lower than the human equivalent dose (HED) of the NOAEL in monkeys and rats, respectively. At a dose of 2.4 mg IV, the predicted human Cmax and area under the concentration-time curve (AUC) is 5,430-fold and 2,980-fold lower, respectively, than the Cmax and AUC observed at the NOAEL of 150 mg/kg in monkeys. The highest dose of 960 mg IV is 4.5-fold and 2.3-fold lower than the HED of the NOAEL in monkeys and rats, respectively. At 960 mg IV, the predicted human Cmax and AUC is 14-fold and 7.5-fold lower than the Cmax and AUC observed at the NOAEL of 150 mg/kg in monkeys.

[0557] For each SC cohort, subjects are randomized 4:2 to receive a single SC dose (80 mg) of 26 TACI CRD2-Fc or placebo, respectively, on Day 1. The subjects in the subcutaneous cohort are administered a single dose of one of the following doses levels or placebo: 80 mg, 240 mg, 480 mg, and 960 mg. As part of the assessment of the pharmacodynamics of 26 TACI CRD2-Fc, each subject further receives a single SC injection of 1 mg keyhole limpet hemocyanin (KLH) on Day 1 (IV arm) or on Day 2 (SC arm), post administration of 26 TACI CRD2-Fc.

[0558] Baseline assessments are performed before the dose on Day 1. After dosing, the subjects are followed for safety and PK/PD for 29 days until the end of the study (EOS). Subjects with quantitative immunoglobulin G (IgG) that is below the lower limit of normal at EOS are followed for assessment of quantitative Ig levels until there is evidence of recovery of Ig production. Safety is based on the incidence, severity and seriousness of adverse events, including clinically significant changes in physical exam findings, vital signs, laboratory tests (hematology, serum chemistry, coagulation, and urinalysis), and electrocardiograms.

[0559] Serum concentrations of 26 TACI CRD2-Fc are measured over time and PK endpoints are estimated, including maximum observed concentration (Cmax), time to maximum

observed concentration (tmax), area under the concentration-time curve (AUC), and bioavailability of SC dosing. PD endpoints are measured and include (1) serum anti-KLH immunoglobulin (IgA, IgG and IgM) levels and their corresponding changes from baseline over time; and (2) Serum IgM, IgG (total, IgG1, IgG2, IgG2 and IgG4), IgA (total, IgA1 and IgA2), and IgE levels, and their corresponding changes from baseline over time. The incidence of anti-drug antibodies (ADA), time to first ADA, and titer of ADA against 26 TACI CRD2-Fc is assessed. Exploratory endpoints, including circulating B and T lymphocytes including their subtypes (such as transitional B cells, follicular B cells, marginal zone B cells, plasmablasts and plasma cells), mean serum levels and changes from baseline over time in relevant circulating biomarkers are measured.

[0560] Results demonstrated that the exemplary TACI CRD2-Fc was well tolerated in all IV and SC cohorts. Serum IgA, IgG, IgM levels, and their corresponding changes from baseline over time were measured (**FIG. 25C**). All cohorts exhibited dose-dependent PK and expected PD effects on circulating Ig levels, including reductions in serum Ig starting at 8 mg IV (~0.1 mg/kg). No treatment-related serious adverse events, infusion reactions, or adverse trends in safety laboratory parameters were reported in any of the dosed cohorts.

[0561] Results from the study indicate that the exemplary TACI CRD2-Fc demonstrates acceptable preliminary safety and tolerability, and exhibits expected PD effects on circulating Ig and B cell populations. These findings support future clinical development of exemplary TACI CRD2-Fc in patients with SLE and/or other B cell- and/or autoantibody-related diseases.

Example 14. Assessment of TACI inhibition of class-switched memory B cell, plasma cells, and Ig secretion.

[0562] This Example describes studies assessing primary human B cell differentiation and immunoglobulin (Ig) secretion in vitro. Assessments of activity included B cell maturation as assessed by flow immunophenotyping, and measurement of secreted Ig including IgA, IgM, IgG2, in the culture supernatants.

[0563] Total CD19⁺ B cells were isolated from PBMCs (N=7 donors) using negative selection kits from StemCell Technologies. Isolated B cells were resuspended to approximately 2×10^6 cells/mL in X-VIVO 15TM medium supplemented with 1X GlutaMAX, 1X P/S and rhIL-21 (50 ng/mL). CD40L was added to B cells at a concentration of 2 nM, and cells were plated into 12-well plates (2 mL/well). $8 \times 10^6 - 4.8 \times 10^7$ total B cells were plated for each donor depending on the number of B cells isolated. Cells were incubated 3 days at 37°C with

5% CO₂. On Day 3, B cells were harvested from the 12-well plates. Wells were washed with 1 mL/well PBS and treated 10 min with 37°C Versene (1 mL/well) to remove adherent cells. Washes and detached cells were pooled with the other harvested cells for each respective donor. Cells were centrifuged and the media removed. Cell pellets were washed with 5-25 mL volumes DPBS. Cells were suspended in 1-5 mL DPBS and counted.

[0564] Activated B cell concentrations were adjusted to 1×10^7 /mL in DPBS. Equivalent volumes of CFSE (0.5 μ M) in DPBS were added to cells (0.25 μ M final). Cells were incubated 10 min at 37°C. After 10 min, 1-5 mL FBS were added, and cells were incubated for 5 min at 37°C to quench labeling. Cells were washed twice with a 5-fold volume of X-VIVO 15™. After the second wash, cells were suspended in 1-2 mL X-VIVO 15™ and counted.

[0565] B cells (+/- CFSE) were suspended at $0.3 - 1.0 \times 10^6$ cells/mL ($0.3 - 1.0 \times 10^5$ /test) in 37°C serum-free X-VIVO 15™ medium supplemented with 1X GlutaMAX, 1X P/S and rhIL-21 (20 ng/mL). 100 μ L volumes of B cells were added to prepared microplates containing 5 APRIL and BAFF (10 nM) in the presence of titrated test articles Fc control, anti-APRIL mAb BION-1301 (e.g. SEQ ID NO: 50 and 52 from U.S. Patent No. 10,377,830), belimumab, 26 TACI CRD2-Fc (TACI vTD SEQ ID NO:26; Fc fusion SEQ ID NO: 167) or WT TACI-Fc sequences corresponding to atacicept (containing a WT TACI 30-110 SEQ ID NO:132; SEQ ID NO:130) or telitacicept (containing WT TACI 13-118, SEQ ID NO:131).

[0566] Cultured cells were analyzed by flow cytometry for CFSE and stained with antibodies for CD38, IgM, CD319, IgD and CD27. The percent (%) of class-switched memory B cells (IgD-IgM-CD27⁺), and plasma cells (IgM-IgD-CD38⁺CD319⁺) were determined. The percent inhibition of class-switched memory B cells (**FIG. 26A**) or plasma cells (**FIG. 26B**) was determined by comparison of the % of such cells in the presence of test article versus in the absence of the test article. Data from 7 donors are shown, representing an average ($\pm$ SEM) of 3 replicates for each condition. As shown, 26 TACI CRD2-Fc inhibits class-switched memory B cell and plasma cells more potently than WT TACI-Fc in primary human B cells.

[0567] To assess Ig secretion, supernatants from the cultures were collected and Ig secretion was quantitated by multiplex analysis. Media from the APRIL and/or BAFF-conditioned cultures were assayed using an immunoglobulin MILLIPLEX® kit (EMD Millipore, # HGAMMAG-301K) with magnetic beads and antibodies specific for detecting soluble IgM, IgG1, IgG2, IgG3, IgG4, and IgA. B cell culture supernatants (CM) were collected following centrifugation and diluted either 1:10 or 1:20 into MILLIPLEX® kit assay buffer. MILLIPLEX® kit immunoglobulin standard was solubilized into 500 μ L water and serially diluted 1:3 into kit

assay buffer. MILLIPLEX[®] map immunoglobulin positive control was solubilized in 250 μ L water. Fifty μ L of standards, positive control, and diluted CM were plated onto 96-well Bio-Plex Pro[™] Flat Bottom Plates. 50 μ L of assay buffer alone was also added for the assay Blank control. All magnetic beads from the MILLIPLEX kit were sonicated and vortexed. A cocktail of the 6 Immunoglobulin-specific magnetic beads were prepared in kit assay buffer. The prepared bead cocktail (25 μ L) was added to all wells. Plates were sealed and shaken vigorously at 500 rpm for 1 hr at 25°C while protected from light. After a 1 hr incubation, plates with beads were washed using the magnetic bead washing protocol on a Cytex plate washer with prepared 1X MILLIPLEX[®] kit wash buffer. Kit antibody cocktail (25 μ L/well) for detecting soluble IgA, IgM, IgG1, IgG2, IgG3, and IgG4 was first captured by the magnetic beads and then added to the plates. Plates were sealed and shaken vigorously at 500 rpm for 30 min at 25°C while protected from light. After 30 min, 25 μ L/well 1X SA-PE was added and sealed plates returned to the shaker. Prior to reading the reacted magnetic beads and their fluorescence signal on the calibrated LUMINEX[®] instrument, plates were seated onto a plate magnet for 1 min. Detection reagents were flicked off and 150 μ L/well MAGPIX[®] drive fluid was added. LUMINEX[®] was programmed to read 100 beads minimally of each analyte and measure PE fluorescence for the 6 individual beads. Standard curves were generated using GraphPad Prism from Standard ng/mL concentrations and mean fluorescence intensities (MFIs) for each analyte. Secreted Ig levels in the CM were interpolated from the standard curves in GraphPad Prism and back-calculated for their respective dilutions. These results were further analyzed in GraphPad Prism for IC₅₀ calculation using a 4-parameter curve fit.

[0568] For APRIL+BAFF cultures, the percent inhibition of Ig secretion was determined using the following formula: $([\text{Median APRIL+BAFF Ig value} - \text{Experimental Ig value}] / \text{Median APRIL+BAFF Ig value}) \times 100$. Percent inhibition was calculated relative to APRIL-only and BAFF-only wells for IgM (**FIG. 26C**), IgA (**FIG. 26D**), and IgG2 (**FIG. 26E**). Data represent an average ($\pm$ SEM) of three replicates for each condition (* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, **** $p < 0.0001$). The results demonstrated that 26 TACI CRD2-Fc inhibits Ig secretion more potently than WT TACI-Fc in primary human B cells. Similar inhibition by 26 TACI CRD2-Fc was observed for other IgG subtypes (IgG1, IgG3, and IgG4). Percent inhibition of IgG1 and IgG4 could not be calculated for belimumab or BION-1301, respectively, as the multiplex kit detects the Fc contained within the test article.

Example 15. Assessment of TACI inhibition on plasma cell numbers in mice and non-human primates.

[0569] The effect of the exemplary TACI-Fc designated 26 TACI CRD2-Fc on plasma cell numbers was assessed in mouse and non-human primate models.

[0570] For assessment in mice, collagen-induced arthritis (CIA) was induced in male DBA/1 mice by immunization with bovine collagen/CFA on Day 0 and bovine collagen/CFA booster on Day 18. CIA is mediated by both T cells and antibodies (B cells).

[0571] Mice were dosed with TACI domain-containing molecules 26 TACI CRD2-Fc (TACI vTD SEQ ID NO:26; Fc fusion SEQ ID NO: 167) and TACI 13-118 -Fc (corresponding to the TACI ECD portion in telitacicept set forth in SEQ ID NO:131 with effectorless IgG1 Fc, SEQ ID NO:241; see also SEQ ID NO:3 of U.S. Patent 8,193,316). For comparison, mice also were dosed with mBAFF-R-Fc (UniProt Q9D8D0) and anti-mAPRIL monoclonal antibody (WO 2017/091683 A1 SEQ ID NO: 161 and 162. Mice received 6 doses of each test article twice weekly (10 mg/kg). Mice were sacrificed, and their spleens, bone marrow and lymph nodes were isolated for flow cytometry analysis of plasma cells.

[0572] Each sample was then stained for flow cytometry analysis of immune cell subsets using the following method: 1×10^6 live cells were placed into a well of a 96-well plate (Corning, Cat. 3797; for a B cell-specific panel), centrifuged at $1500 \times g$ for 10 seconds, the supernatant removed, and the cell pellet washed twice with DPBS. The pellets were resuspended in 100 μ L of live-dead stain (LIVE/DEAD Fixable Aqua Dead Cell Stain Kit, Life Technologies Corp., 1:1000 dilution in DPBS) and incubated for 10 min in the dark at room temperature. Following two washes with flow cytometry buffer (175 μ L each), pellets were resuspended in Mouse BD Fc Block (diluted 1:50 with flow buffer), and incubated in the dark for an additional 5 min at RT. Without any additional washes, 50 μ L of a cocktail of the following flow cytometry antibodies (diluted in flow cytometry buffer) were added to each well of cells for the B panels. For the B cell panel, the following antibodies were combined for the cocktail: anti-mouse CD19 BUV395 (clone 1D3, Becton-Dickinson; 1:100), anti-mouse CD138 BV421 (clone 281-2, BioLegend Inc.; 1:100, final concentration), anti-mouse CD3 ϵ BV510 (clone 17A2, BioLegend Inc.; 1:100, final concentration), anti-mouse IgD BV605 (clone 11-26c.2a, BioLegend Inc.; 1:100, final concentration), anti-mouse B220 BV785 (clone RA3-6B2, BioLegend Inc.; 1:100, final concentration), anti-mouse CD95 FITC (clone SA367H8, BioLegend Inc.; 1:100, final concentration), anti-mouse CD23 PerCP Cy5.5 (clone B3B4, BioLegend Inc.; 1:100, final concentration), anti-mouse GL7 PE (clone GL7, BioLegend Inc.;

1:100, final concentration), anti-mouse Gr1 PE Cy7 (clone RB6-8C5, BioLegend Inc.; 1:100, final concentration), anti-mouse CD21 APC (clone 7E9, BioLegend Inc.; 1:100, final concentration), and anti-mouse IgM APC Cy7 (clone RMM-1, BioLegend Inc.; 1:100, final concentration). The cells were incubated with one of the antibody cocktails in the dark, on ice, with gentle mixing for 45 min, followed by two washes with flow cytometry buffer (175 μ L per wash). Cell pellets were resuspended in 200 μ L flow cytometry buffer and collected on an LSRII flow cytometer. Data were analyzed using FlowJo software version 10.2 (FlowJo LLC, USA) and graphed using GraphPad Prism software (Version 8.1.2). Key cellular subset identification analysis included: plasma cells (CD138^{high} TACI^{high}).

[0573] As shown in **FIGs. 27A-C** TACI CRD2-Fc significantly decreased the total plasma cell numbers in the bone marrow (**FIG. 27A**), spleen (**FIG. 27B**), and the lymph node (**FIG. 27C**), relative to the Fc control, WT TACI-Fc, mBAFF-R-Fc, and/or anti-mAPRIL monoclonal antibody.

[0574] For a non-human primate GLP 1-month toxicology study, as described in Example 17, 26 TACI CRD2-Fc (TACI vTD SEQ ID NO:26; Fc fusion SEQ ID NO: 167) was administered to cynomolgus monkeys via subcutaneous injections at dose levels 25 mg/kg, 75 mg/kg or 150 mg/kg once weekly of five consecutive weeks; control animals were injected with vehicle (buffer), alternating between IV and SC routes of administration. Bone marrow smears were examined at low magnification (200X and 400X) to review the cellularity of the smears and to locate an appropriate monolayer area in which to perform cell counting. Plasma cells and other nucleated cells were counted (using two keys) with the Unico® counter at 500X oil immersion to determine the number of plasma cells per 500 total nucleated cells; the percentage of plasma cells was calculated to the nearest decimal point by dividing the number of plasma cells by 500.

[0575] As shown in **FIG. 28**, the plasma cells were observed in low numbers, as expected, with some variation among the animals. Lower plasma cell counts were observed in animals dosed with 26 TACI CRD2-Fc relative to those from the vehicle control group, with a statistically significant decrease observed with ≥ 75 mg/kg by SC. These lower plasma cell counts are consistent with an effect from 26 TACI CRD2-Fc administration.

Example 16. Multiple Dose Toxicology Study of TACI vTC-Fc in Sprague Dawley Rats.

[0576] This Example describes a 1-month GLP toxicology study in Sprague Dawley (SD) following of the exemplary TACI vTD-Fc designated 26 TACI CRD2-Fc (SEQ ID NO:167), when administered by 5 weekly doses of subcutaneous injection or intravenous slow bolus injection for 4 weeks to SD rats.

[0577] Male and female SD rats were divided into five groups (Groups 1 to 5). Groups 2 to 5 (terminal population) included ten males and ten females per group and Groups 4 and 5 (recovery population) included five males and five females per group. Animals were dosed by subcutaneous injection into the interscapular area once weekly on Days 1, 8, 15, 22, and 29 (Groups 1 to 4) and by slow intravenous (IV) injection over 1 min via tail vein once weekly for five weeks, i.e. on Days 1, 8, 15, 22, and 29 (Groups 1 and 5). For control animals, the slow IV injection will be performed after the subcutaneous injection. Dose formulations were administered using a temporary catheter and syringe. The vehicle control article, 10 mM acetate, 3% proline, 0.015% polysorbate 80, pH 5.2, was administered to 10 males and 10 females Sprague Dawley rats (Group 1; terminal population) and 5 males and 5 females (Group 1; recovery population). A separate population was assigned to the study for toxicokinetic assessments, which included 3 male and 3 female Sprague Dawley rats in Group 1, and 9 male and 9 female Sprague Dawley rats in Groups 2 to 5. Animals in Groups 2 to 4 were dosed via subcutaneous (SC) injection and animals in Group 5 were dosed via slow intravenous (IV) injection once weekly on Days 1, 8, 15, 22, and 29. Group 1 animals received the control article via SC injection followed by slow IV injection. Groups 2 through 5 received 26 TACI CRD2-Fc at dose levels of 25, 75, 200 mg/kg SC, and 200 mg/kg IV, respectively. Dose formulations were accurately prepared, based on the analytical results from preparations used for dosing on Days 1 and 29. Necropsy of the terminal population was performed on Day 30 and recovery necropsy will be performed on Day 127.

[0578] Safety endpoints included clinical observations, detailed examinations, food consumption evaluation, body weights, ophthalmology, hematology, coagulation, serum chemistry, serum immunoglobulins, urinalysis, and anti-drug antibodies (ADA). Blood was collected at multiple time points to characterize 26 TACI CRD2-Fc serum concentrations over time. At termination, gross observations and organ weights were recorded, and tissues were collected for microscopic evaluation.

[0579] Toxicokinetic parameters were imported into Phoenix WinNonlin software (Pharsight Corp/Certara) for 26 TACI CRD2-Fc (concentration and time). Non-compartmental analysis was applied on the mean composite serum concentrations using nominal collection times and nominal dose times.

[0580] 26 TACI CRD2-Fc-related serum chemistry changes in male and female rats administered ≥ 25 mg/kg included minimally lower globulin concentrations and minimally higher albumin to globulin (A/G) ratios on Day 30. Immunoglobulin IgA and IgM concentrations were lower than acclimation values on Day 8 and were moderately to markedly below control values on Day 15 and Day 29, which contributed to overall lower globulin concentrations. Subcutaneous administration of 25 mg/kg to 200 mg/kg 26 TACI CRD2-Fc resulted in transiently lower IgG concentrations on Day 8; intravenous administration of 200 mg/kg 26 TACI CRD2-Fc resulted in persistently lower IgG concentrations through Day 29, in male and female animals. Significant decreases in mean spleen weights were noted in all treatment groups. 26 TACI CRD2-Fc-related microscopic findings were observed on Day 30 in the spleen, lymph nodes, and injection site. Decreased lymphocyte cellularity in the spleen and lymph nodes was noted in animals administered 200 mg/kg via SC or IV injection. The decreased cellularity in the spleen correlated with decreased spleen weights. Increased incidence and severity of decreased lymphocyte cellularity of the follicles in the lymph nodes (mesenteric and mandibular) was also observed in animals treated with 200 mg/kg 26 TACI CRD2-Fc by SC or IV injection. Subcutaneous inflammatory changes (mononuclear cell infiltrates and/or fibroplasia) were slightly increased at the SC injection site in animals that received 200 mg/kg compared to those at the control article injection site, which was considered to be an exacerbation of commonly observed procedure-related changes.

[0581] In conclusion, 26 TACI CRD2-Fc administered by subcutaneous injection or intravenous injection to Sprague Dawley rats at 25, 75, 200 mg/kg SC, and 200 mg/kg IV for 4 weeks resulted in lower serum globulin attributed to decreased immunoglobulin (IgA, IgM and IgG) concentrations and decreased lymphocyte cellularity in the spleen and lymph nodes, all consistent with the mechanism of action of 26 TACI CRD2-Fc. As none of the effects were considered adverse, the NOAEL (Non-Observable-Adverse-Effect-Level) was determined to be 200 mg/kg by subcutaneous or intravenous injection.

Example 17. Multiple Dose 1-Month GLP Toxicology Study of TACI vTD-Fc in Cynomolgus Monkeys.

[0582] This Example describes a 1-month GLP toxicology study in cynomolgus monkey to examine the effects of the exemplary TACI vTD-Fc designated 26 TACI CRD2-Fc (SEQ ID NO:167), when administered by once weekly subcutaneous injection for 4 weeks (5 total doses) to cynomolgus monkeys.

[0583] Male and female cynomolgus monkeys were divided into groups. Animals were dosed by subcutaneous injection (Groups 1 to 4) once weekly for five consecutive weeks on Days 1, 8, 15, 22 and 29. Group 1 animals received vehicle control (10 mM acetate, 3% proline, 0.015% polysorbate 80, pH 5.2). Group 2 to 4 animals were administered 26 TACI CRD2-Fc (SEQ ID NO:167), at dose levels of 25, 75, or 150 mg/kg, respectively. Animals in an additional group 5 were administered 26 TACI CRD2-Fc (SEQ ID NO:167), at dose level 150 mg/kg via intravenous infusion.

[0584] Toxicokinetic parameters were imported into Phoenix WinNonlin software (Pharsight Corp/Certara) for analysis for 26 TACI CRD2-Fc (concentration and time). Non-compartmental analysis was applied on the individual subject serum concentration using nominal collection times and nominal dose levels. Dose-dependent PK observed in this model is set forth in **FIG. 29A**. Additional parameters calculated were bioavailability 87.4 % (%F) at 150 mg/kg and elimination half-life ($T_{1/2}$) of approximately 2.9 days.

[0585] Flow cytometry analysis was performed on peripheral blood samples collected on Days -8, 8, 15, 22, and 29 on control animals (Group 1) and animals treated with 25 mg/kg SC (Group 2), 75 mg/kg SC (Group 3), 150 mg/kg SC (Group 4), and 150 mg/kg IV (Group 5) of 26 TACI CRD2-Fc (SEQ ID NO:167) collected on Day -8 before dosing (baseline) and on Days 8, 15, 22, and 29 after dosing. Cell immunophenotyping was performed on collected peripheral blood and relative percentages and absolute counts for populations for CD3-CD20+ (total B cells), CD3-CD20+CD21+CD27- (naïve B cells), and CD3-CD20+CD21+CD27+ (memory B cells). To determine TACI-related changes, averages of relative percentages and absolute counts values per group after dosing were compared to the baseline value (Day -8) of respective treatment groups and to trends observed in control Group 1. Flow cytometry analysis indicated multiple changes in the absolute counts and relative percentage values of CD3-CD20+ B cells and subsets following 26 TACI CRD2-Fc administration (**FIG. 29B**). All of the observed changes were characterized by a decrease in relative percentages or absolute counts. Since these decreases were observed in multiple B cell subsets and in both males and females, to the results

are consistent with an effect of the 26 TACI CRD2-Fc administration. For populations CD3-CD20+CD21+ and CD3-CD20+CD21+CD27-, moderate (two-fold) decreases were observed in absolute counts compared to baseline and Group 1 values starting on Day 15 in both male and female treatment groups.

[0586] Serum cytokines were also measured as a non-GLP exploratory endpoint in this study. Frozen serum samples collected predose (Day 1), then 2 hours (Day 1), 6 hours (Day 1), and 24 hours (Day 2) following the first dose of 26 TACI CRD2-Fc were provided frozen on dry ice. Serum samples (from 42 animals, N=168 samples total) were thawed, vortexed for 30 seconds, then stored at 4°C prior to assay. Samples were plated in duplicate wells (25 µL/well) and concentrations of a panel of cytokines were measured using the Millipore Milliplex NHP Cytokine Assay kit (catalog # PRCYTA-40K; Lot # 3739326) and analyzed with a Luminex 200® System with xPONENT® 4.2 software (EMD Millipore, Burlington, MA). As compared to samples from vehicle treated control animals, and to intra-animal pre-dose measurements, no significant changes were induced by 26 TACI CRD2-Fc treatment in any of the cytokines evaluated (IL-2, IL-4, IL-6, IL-8, IL-10, IFN γ , or TNF α).

[0587] In conclusion, 26 TACI CRD2-Fc administered by subcutaneous injection or intravenous injection to cynomolgus monkeys at 25, 75, and 150 mg/kg SC or 150 mg/kg IV for 4 weeks resulted in non-adverse lower mean total protein and globulin values. Decreased serum globulin (secondary to decreased IgA, IgM and IgG) concentrations, possibly related to lower B cell populations and plasma cell counts in the marrow, and consistent with the mechanism of action of 26 TACI CRD2-Fc were observed at all dose levels (**FIG. 30**). As such, the NOAEL (Non-Observable-Adverse-Effect-Level) was considered to be 150 mg/kg by subcutaneous injection.

Example 18. Evaluation of TACI vTD-Fc in a Chronic Graft Versus Host Disease (cGVHD) model of Lupus.

[0588] This Example describes the evaluation of the *in vivo* activity of TACI vTD-Fc designated 26 TACI CRD2-Fc (SEQ ID NO:167) in comparison to a WT TACI (13-118) Fc containing a wild-type Fc that can mediate effector function (SEQ ID NO: 240), when administered using a repeat dosing regimen in the bm12-to-C57BL/6NJ mouse inducible model of SLE. In this model, splenocyte suspensions from female I-A^{bm12}B6(C)-H2-Ab1^{bm12}/KhEgJ ('bm12') mice were adoptively transferred via intraperitoneal delivery into female C57BL/6NJ recipient mice. H2-Ab1^{bm12} differs from H2-Ab1^b by 3 nucleotides, resulting in an alteration of 3

amino acids in the β -chain of the MHC class II I-A molecule. Alloactivation of donor bm12 CD4⁺ T cells by recipient antigen presenting cells leads to chronic GVHD with symptoms closely resembling SLE, including autoantibody production, changes in immune cell subsets, and mild kidney disease. Increased serum IgG and anti-dsDNA occur approximately 1-2 weeks post-transfer of splenocytes. Glomerulonephritis with immune complex deposition develops late in the model (12-14 weeks post-transfer), largely comprised of autoantigens bound to IgG1, IgG2b, IgG2c, and IgG3 antibodies. Endpoints of this study included immune cell subset composition in the spleen and renal IgG immune complex deposition in the kidney.

[0589] To begin the study, spleens from 40 bm12 mice, and inguinal lymph nodes from 20 of those mice, were processed aseptically to single cell suspensions in RPMI media, pooled, and injected via intraperitoneal (IP) delivery to 39 C57BL/6 ‘recipient’ mice (Groups 1 – 4) as shown in **Table E37**. A total of 8 mL of pooled lymph node cells/splenocytes were prepared and each of the 39 recipient mice received 0.2 mL of the pooled bm12 cells. C57BL/6 ‘recipient’ mice received 1 of 3 test articles (Groups 1 – 4) by IP injection, with the first dose being 5 days after the transfer of bm12 splenocytes; the last dose was administered 6 days prior to termination (last dose during week 14). Six C57BL/6 and 5 bm12 mice were retained for use as naïve, untreated controls over the course of the study.

Table. E37. Test Article Description and Dose Regimen					
Group #	# of mice	Test Article(s)	Dose Level (μg)	Dose Schedule (D = Study Day)	Route of Delivery
1	13	Fc control	80*	2x weekly, D5 start	IP
2	13	26 TACI CRD2-Fc	200	2x weekly, D5 start	IP
3	13	WT TACI (13-118) Fc	240	2x weekly, D5 start	IP
4	6	None (naïve BL/6)	N/A	N/A	N/A

*molar matched to Fc control

N/A = not applicable

[0590] Blood was collected every 1 – 2 weeks and processed to serum and test article concentrations were measured to confirm expected exposure. Mice were sacrificed at week 14 and blood was terminally collected under isoflurane anesthesia. Spleens were collected at termination from each mouse, weighed and processed to single-cell suspensions for immunophenotyping by flow cytometry. Total cell counts were obtained on a Cellometer (Nexcelom Bioscience).

[0591] As shown in **FIG. 31**, administration of WT TACI-Fc and 26 TACI CRD2-Fc significantly reduced spleen weights as well as total number of spleen cells as compared to the controls treated mice. Immunophenotyping of splenocytes by flow cytometry revealed highly significant reductions in the numbers of CD45⁺ and B220⁺ in the WT TACI-Fc and 26 TACI CRD2-Fc treated groups (**FIG. 32**). A modest reduction in the number of CD3⁺ T cells in was also observed in both treatment groups.

[0592] As shown in **FIG. 33**, WT TACI-Fc and 26 TACI CRD2-Fc significantly decreased the numbers and percentages of CD4⁺ and CD8⁺ T cells in the spleen. Further, the two test articles reduced the CD4⁺ T cell subsets that are important in antibody-mediated disease (**FIG. 34**). Mild reductions in the number of regulatory T (Treg) cells were observed; however, as both WT TACI-Fc and 26 TACI CRD2-Fc significantly decreased the number of follicular T helper (Tfh) cells, treatment with each test article also increased the ratio of Treg to Tfh cells (**FIG. 34**).

[0593] As shown in **FIG. 35A**, WT TACI-Fc and 26 TACI CRD2-Fc significantly decreased B cell numbers, including numbers of CD1d^{hi}CD5⁺ B-1 cells. 26 TACI CRD2-Fc had little effect on the number of Transitional-1 (T1) B cells, but dramatically reduced the number of Transitional-2 (T2) B cells, as expected based on the reliance of B cells beyond the T-1 stage of development on BAFF and APRIL for survival (**FIG. 35B**). Thus, WT TACI-Fc and 26 TACI CRD2-Fc also significantly decreased the numbers of follicular and marginal zone (MZ) B cells (**FIG. 36A**), germinal center (GC) B cells, and plasma cells (**FIG. 36B**). 26 TACI CRD2-Fc, and less so WT TACI-Fc, significantly decreased the number of various immunoglobulin-secreting B cells, including early plasma cells, plasmablasts, and long-lived plasma cells (LL-PC) (**FIG. 37**).

[0594] For **FIG. 38**, kidneys were collected at termination from each mouse and frozen in optimal cutting temperature compound (OCT) block before sectioning and immunohistochemical (IHC) staining with a fluorescently-labeled antibody specific for mouse IgG. 26 TACI CRD2-Fc treatment led to highly significantly decreased renal IgG immune complex deposits as compared to the Fc control (**FIG. 38**). Furthermore, WT TACI-Fc and 26 TACI CRD2-Fc significantly reduced the serum titers of anti-dsDNA autoantibodies as compared to the Fc control at weeks 8 and 13 (**FIG. 39**).

[0595] Results demonstrate that 26 TACI CRD2-Fc significantly reduced splenic Tfh, GC B cells, and PC populations that are key in the cGVHD model and in antibody-mediated disease.

26 TACI CRD2-Fc also significantly reduced anti-dsDNA antibodies in serum and inhibited IgG immune complex deposition in the kidneys.

Example 19. Evaluation of TACI vTD-Fc in a H-2^{bm12} Mouse Model of Autoantibody-Related Glomerulonephritis

[0596] This Example describes the evaluation of the activity of TACI vTD-Fc designated 26 TACI CRD2-Fc (SEQ ID NO:167) compared to Fc control in the bm12 mouse model of chronic GVHD. Alloactivation of donor T cells in the GVHD model leads to clinical, serological and histopathological manifestations that mimic multiple systemic autoimmune diseases, including autoantibody-related glomerulonephritis.

[0597] To begin the study, mice were dosed twice weekly for 12.5 weeks with TACI-Fc or Fc control. Naïve C57BL/6NJ mice were included as control animals. Endpoints evaluated included anti-double stranded (ds) DNA antibodies, analysis of splenic immune cell subsets, and renal IgG deposition via immunohistochemistry. Results demonstrated that 26 TACI CRD2-Fc treatment significantly reduced anti-dsDNA autoantibodies (**FIG. 40**), glomerular IgG immune deposits (**FIG. 41**) compared to Fc controls. Immunophenotyping of splenocytes demonstrated that 26 TACI CRD2-Fc treatment resulted in significant reductions of key immune cell subsets, including germinal center (GC), marginal zone (MZ), mature T2, and follicular B cells, antibody-producing plasma cells, and plasma cell subsets. Significant reductions were also observed in CD4⁺ follicular helper T cells, regulatory T cells, CD4⁺ effector memory T cells, and CD4⁺ and CD8⁺ central memory T cells. 26 TACI CRD2-Fc also significantly reduced serum levels of IgA, IgM, IgG1, IgG2b, and IgG3 (**FIG. 42**).

[0598] Results demonstrate that 26 TACI CRD2-Fc significantly suppressed the formation of autoantibodies and significantly reduced glomerular IgG deposition as compared to Fc control treatment; in addition to inhibiting the expansion of key B and T cell subsets.

Example 20. Multiple Dose 26-Week Toxicology Study of TACI vTD-Fc in sexually mature Cynomolgus Monkeys

[0599] This Example describes a toxicology study in sexually mature cynomolgus monkeys to evaluate the potential toxicity of TACI vTD-Fc designated 26 TACI CRD2-Fc (SEQ ID NO:167) when administered by once weekly intravenous infusion for 26 weeks (26 doses) followed by a 12-week recovery.

[0600] The experimental study design is shown in Table E38.

Table E38. Experimental Study Design						
Group	Test Material	Dose Level (mg/kg)	Terminal (Male)	Terminal (Female)	Recovery (Male)	Recovery (Female)
1	Control	0	4	4	2	2
2	26 TACI CRD2-Fc	25	4	4	2	2
3	26 TACI CRD2-Fc	75	4	4	2	2

[0601] TACI-Fc was well tolerated with all animals surviving to scheduled necropsy. No TACI-Fc-related changes in clinical signs, vital signs, body weight, menstrual cycles, testicular volume, semen, ophthalmology, coagulation, urinalysis, anatomic and gross pathology, organ weights, and histopathology were observed.

[0602] Consistent with the anticipated effects of 26 TACI CRD2-Fc, changes in immunoglobulins and bone marrow plasma cells were observed. Lower plasma cells were observed in the bone marrow smears from most of the animals in the 25 and 75 mg/kg dose groups at terminal necropsy. Related to the plasma cell observations, statistically significant changes in serum chemistry were observed in animals administered with 26 TACI CRD2-Fc, including, mild, moderate, and/or marked, generally progressive, dose-dependent decreases in IgG, IgM, and IgA values from Day 29 through Day 183. The immunoglobulin changes were associated with statistically significant, minimal to mild, decreases in mean values for globulin and total protein concentrations and minimal to mild increases in mean albumin/globulin (A/G) ratios in animals administered with 26 TACI CRD2-Fc from Day 29 through Day 183. No other TACI-Fc-related changes were observed in the hematology parameters assessed, except for minimally lower mean lymphocyte counts within the normal range of healthy monkeys, in 75 mg/kg males on Day 183, attributable to two animals.

[0603] Statistically significant changes in total B cells (CD3-CD20+) were noted by immunophenotyping and are likely attributed to 26 TACI CRD2-Fc administration. Otherwise, there was no evidence of the effect of TACI-Fc administration in the other cell populations evaluated. NOAEL was observed to be 75 mg/kg/day.

Example 21. Administration of TACI-Fc fusion protein in Subjects with Autoantibody-Associated Glomerular Disease

[0604] Adults with a diagnosis of autoantibody-associated glomerular disease are administered a composition containing TACI vTD-Fc fusion protein designated 26 TACI CRD2-Fc (Fc fusion protein set forth in SEQ ID NO:167). The TACI vTD-Fc fusion protein composition is formulated as a 100 mg/mL liquid in single-use glass vials with extractable volumes of 0.8 mL/vial (80 mg per vial). Safety and response to administration of the TACI vTD-Fc fusion protein are assessed. The study is part of an ongoing clinical trial study.

Subjects and Treatment

[0605] A group of adult human subjects are selected for administration of a dose of TACI vTD-Fc fusion protein in one of 3 ascending dose cohorts. The subjects are those with a diagnosis of autoantibody-associated glomerular disease, including immunoglobulin (Ig) A nephropathy (IgAN), lupus nephritis (LN), primary membranous nephropathy (pMN), or renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV) are enrolled.

[0606] The inclusion criteria for the subjects includes autoantibody-associated glomerular disease of one of the following types: a) Immunoglobulin (Ig) A nephropathy (IgAN), with i) a biopsy-confirmed diagnosis within ≤ 3 years prior to the start of screening, and ii) elevated galactose deficient igA1 (GdIgA1) antibodies at screening; b) Lupus nephritis (LN), with i) biopsy-confirmed diagnosis within ≤ 1 year prior to the start of screening (renal biopsies showing evidence of active, proliferative class III or IV LN per the international society of nephrology/renal pathology society (ISN/RPS) criteria; subjects may co-exhibit class V disease in addition to either class III or class IV disease), ii) elevated anti-double stranded DNA (anti-dsDNA) at screening, and iii) positive for anti-nuclear antibody (ANA) with titers of $\geq 1:80$ at screening; c) primary membranous nephropathy (pMN), with i) biopsy-confirmed diagnosis within ≤ 3 years prior to the start of screening, and ii) positive for anti-phospholipase A2 receptor (anti-PLA2R1) antibodies and/or anti-thrombospondin type-1 domain-containing 7A (anti-THSD7A) antibodies at screening; and d) renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV), with i) biopsy-confirmed diagnosis within ≤ 2 years prior to the start of screening with evidence of renal ANCA-associated vasculitis, ii) positive for anti-proteinase 3 (PR3) or anti-myeloperoxidase (MPO) antibodies at screening, and iii) sustained immunological activity as evidence of well-documented positive PR3 or MPO antibodies within ≤ 6 months prior to the start of screening (the minimum period between screening and historical

ANCA result is ≥ 14 days). In any of the above types, if a biopsy is not performed within the specified timeframe or a report is not available, a biopsy is performed during screening after having met all other eligibility criteria. Additional inclusion criteria include 1) sustained proteinuria, measured as urine protein/creatinine ratio (UPCR) ≥ 0.75 g/g, with the first assessment determined using either 24-hour urine or spot urine collection (visit 1) and a the second assessment ($\geq 14 \pm 3$ days later at visit 2) determined using 24-hour urine collection; and 2) resting systolic blood pressure < 150 mm Hg and resting diastolic blood pressure < 90 mm Hg.

[0607] The adult human subject exclusion criteria include prior diagnosis of or a diagnostic criteria for another renal disease including but not limited to diabetic nephropathy, C3 glomerulonephropathy, focal segmented glomerulosclerosis, thin basement membrane disease, Alport's disease, IgA vasculitis, minimal change disease, post-infectious glomerulonephritis secondary membranous nephropathy (excluding LN class V combined with class II or IV) or secondary IgAN including but not limited to Celiac disease, Crohn's disease, HIV, or liver cirrhosis; previous treatment history of the following within the described period prior to Day 1: rituximab or other agents that directly deplete B lymphocytes (48 weeks), Belimumab or other agents that directly inhibit B cell activating factor (BAFF) and/or a proliferation inducing ligand (APRIL) (24 weeks), intravenous Ig, abatacept, anifrolumab, belatacept, adalimumab, infliximab, certolizumab, etanercept, golimumab, anakinra, canakinumab, tocilizumab, sarilumab, satralizumab, or other marketed biological therapeutics (8 weeks), cyclophosphamide (8 weeks), any non-biological investigational agent (8 weeks or 5 half-lives), and other biological investigational agents (5 half-lives). Other factors of exclusion are within the level of a skilled clinician or physician.

[0608] Subjects are administered a subcutaneous injection of TACI vTD-Fc fusion protein at a dose of 80 mg, 160 mg, or 240 mg once every 2 weeks (Q2W). An intravenous infusion of a may be considered once every 4 weeks (Q4W). The treatment period continues for up to 48 weeks. In some cases, subjects may be administered the dose (e.g. 80 mg) every other week (Q2W), or a lower dose once weekly (Q1W,) for 3-4 doses, and then may be administered that dose or a higher dose Q4W for the treatment period. After treatment, subjects may be monitored such as for safety.

Safety and Efficacy endpoints

[0609] Incidences of Treatment Emergent Adverse Events (TEAEs), Severe Adverse Events (SAEs), and adverse events of interest, dose-limiting toxicities, and treatment-emergent clinically significant abnormalities are monitored.

[0610] Immunological responses including, change from baseline over time in circulating levels of anti-dsDNA in subjects with LN, galactose deficient (Gd)IgA1 and anti-GdIgA1 in subjects with IgAN, and anti-PLA2R1 and anti-THSD7A in subjects with pMN, and anti-MPO, anti-PR-3 in subjects with renal AAV are monitored. Changes from baseline overtime of complement components (C3, C4, CH50) also are monitored.

[0611] Subjects also are monitored for one or more of immunological indices associated with disease activity of subjects with autoantibody-associated glomerular diseases; efficacy of TACI-Fc fusion protein assessed by changes from baseline over time in proteinuria, estimated glomerular filtration rate (eGFR), and associated composite renal function endpoints; and assessment of immunogenicity, pharmacokinetics, pharmacodynamics of TACI-Fc fusion protein in the adult subjects.

[0612] Clinical responses that are monitored in subjects also include change from baseline over time in urine protein:creatinine ratio (UPCR) assessed as 24-hour urine and/or spot urine; changes from baseline over time of estimated glomerular filtration rate (eGFR; e.g. calculated based on the cystatin C, race-independent equation described in Inker, 2021 and Chronic Kidney Disease Epidemiology Collaboration, CKD-EPI, equation); renal response at weeks 24 and 48 (LN and pMN subjects only) for determination of eGFR using cystatin C, race-independent equation (Inker, 2021); changes from baseline over time in physician's global assessment (PGA), and changes from baseline over time in patient's global assessment (PtGA). For LN subjects, changes in baseline over time in SLE disease activity indices (e.g. hybrid SELENA-SLEDAI and SLICC damage index scores) also are monitored. For renal AAV subjects, changes from baseline over time in AAV disease activity indices (e.g. using Birmingham Vasculitis Activity Score (BVAS) and Vasculitis Damage Index (VDI) scores) are monitored.

[0613] Pharmacokinetic (PK) and Pharmacodynamic (PD) endpoints are assessed at the administered doses. Pharmacodynamics (PD) endpoints include changes from baseline over time in serum Ig isotypes (IgM, IgA, total IgG, IgG1, IgG2, IgG3, IgG4, and IgGE), and in peripheral blood lymphocytes and subsets are assessed. In addition, changes in biomarkers related to renal inflammation renal inflammation/damage, lupus activity, and immune pathways mediated through soluble analytes (e.g., BAFF, APRIL, sTACI, sBCMA, sBAFF-R) are monitored. Pharmacokinetics (PK) endpoints including serum and urine levels of TACI-Fc

fusion protein over time are estimated. Incidence and titers of anti-drug antibody (ADA) against TACI-Fc fusion protein are monitored.

[0614] The present invention is not intended to be limited in scope to the particular disclosed embodiments, which are provided, for example, to illustrate various aspects of the invention. Various modifications to the compositions and methods described will become apparent from the description and teachings herein. Such variations may be practiced without departing from the true scope and spirit of the disclosure and are intended to fall within the scope of the present disclosure.

WHAT IS CLAIMED:

1. Use of a TACI-Fc fusion protein in the preparation of a medicament for treating an inflammatory or autoimmune disease or disorder in a human subject, wherein TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D with reference to the amino acid sequence set forth in SEQ ID NO:13, wherein the amino acid position numbering corresponds to that of SEQ ID NO: 122, wherein the TACI-Fc fusion protein is to be administered at a dose of from 8 mg to 960 mg once every week up to once every three months.

2. The use of claim 1, wherein the dose of the TACI-Fc fusion protein is to be administered once every three months, once every month (Q4W), once every other week (Q2W), or once a week (Q1W).

3. The use of claim 1 or 2, wherein the dose of the TACI-Fc fusion protein is from 80 mg to 960 mg, from 80 mg to 720 mg, from 160 mg to 560 mg, from 240 mg to 480 mg, or from 24 mg to 480 mg, from 40 mg to 480 mg, from 80 mg to 320 mg, from 80 mg to 120 mg, from 240 mg to 480 mg; or is 80 mg, 160 mg, or 240 mg.

4. The use of any one of claims 1-3, wherein the medicament is to be administered via intravenous administration or subcutaneous administration.

5. The use of any one of claims 1-4, wherein the variant TACI polypeptide comprises the amino acid sequence set forth in SEQ ID NO:26.

6. The use of any one of claims 1-5, wherein

a) the linker is selected from GSGGS (SEQ ID NO: 76), GGGGS (G4S; SEQ ID NO: 77), GSGGGGS (SEQ ID NO: 74), GGGGSGGGGS (2xGGGGS; SEQ ID NO: 78), GGGGSGGGGSGGGGS (3xGGGGS; SEQ ID NO: 79), GGGGSGGGGSGGGGSGGGGS (4xGGGGS, SEQ ID NO:84), GGGGSGGGGSGGGGSGGGGSGGGGS (5xGGGGS, SEQ ID NO: 91), GGGGSSA (SEQ ID NO: 80), or GSGGGGSGGGGS (SEQ ID NO:194) or combinations thereof; or

b) the linker is set forth in SEQ ID NO:74.

7. The use of any of claims 1-6, wherein the Fc is an IgG1 Fc domain or a variant IgG1 Fc domain that exhibits reduced binding affinity to an Fc receptor and/or reduced effector function as compared to a wild-type IgG1 Fc domain.
8. The use of claim 7, wherein the variant IgG1 Fc domain comprises one or more amino acid substitutions selected from L234A, L234V, L235A, L235E, G237A, S267K, R292C, N297G, and V302C, by EU numbering.
9. The use of claim 7 or 8, wherein the variant IgG1 Fc domain comprises the amino acid substitution C220S, wherein the residues are numbered according to the EU index of Kabat.
10. The use of any of claims 7-9, wherein the variant IgG1 Fc domain lacks the hinge sequence EPKSS or EPKSC.
11. The use of any of claims 7-10, wherein the variant IgG1 Fc domain comprises K447del, wherein the residue is numbered according to the EU index of Kabat.
12. The use of any of claims 1-9 and 11, wherein the Fc comprises the amino acid sequence set forth in SEQ ID NO:73.
13. The use of any of claims 1-9, 11 and 12, wherein the TACI-Fc fusion protein comprises the amino acid sequence set forth in SEQ ID NO:167.
14. The use of any of claims 1-7, and 9-11, wherein the Fc comprises the amino acid sequence set forth in SEQ ID NO:81.
15. The use of any of claims 1-7, 9-11, and 14, wherein the TACI-Fc fusion protein comprises the amino acid sequence set forth in SEQ ID NO:168.
16. The use of any of claims 1-15, wherein one or more of the following is reduced in the subject:

a B cell immune response or activity;
numbers of mature and total circulating B cells;
circulating serum immunoglobulins;
B cell maturation;
B cell differentiation;
B cell proliferation; or
circulating levels of an APRIL or BAFF protein.

17. The use of any of claims 1-16, wherein the inflammatory or autoimmune disease or disorder is a B cell cancer, myeloma, B cell chronic lymphocytic leukemia, Waldenstrom's macroglobulinemia, non-Hodgkin's lymphoma, a renal disease, a graft rejection, graft versus host disease, a viral infection, an autoantibody-associated glomerular disease, immunoglobulin (Ig) A nephropathy (IgAN), lupus nephritis (LN), primary membranous nephropathy (pMN), or renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV).

18. The use of any of claims 1-16, wherein the inflammatory or autoimmune disease or disorder is lupus erythematosus (SLE), lupus nephritis, cutaneous lupus erythematosus, Sjögren's syndrome, scleroderma (systemic sclerosis), multiple sclerosis, diabetes, polymyositis, primary biliary cirrhosis, IgG4-related disease, IgA nephropathy, IgA vasculitis, ANCA vasculitis, microscopic polyangiitis, granulomatosis with polyangiitis, eosinophilic granulomatosis with polyangiitis, cryoglobulinemia, cold agglutinin disease, warm agglutinin disease, immune thrombocytopenic purpura, optic neuritis, amyloidosis, antiphospholipid antibody syndrome (APS), autoimmune polyglandular syndrome type II (APS II), autoimmune thyroid disease (AITD), Graves' disease, autoimmune adrenalitis, pemphigus vulgaris, bullous pemphigoid, myasthenia gravis, graft versus host disease (GVHD), rheumatoid arthritis, acute lupus nephritis, amyotrophic lateral sclerosis, neuromyelitis optica, transverse myelitis, Rasmussen's encephalitis, CNS autoimmunity, Guillain-Barre syndrome, chronic inflammatory demyelinating polyneuropathy, neurocystercercosis, sarcoidosis, antiphospholipid antibody syndrome, IgG4-related disease, Hashimoto's thyroiditis, immune thrombocytopenia, Addison's Disease, or dermatomyositis.

19. The use of any of claims 1-18, wherein the TACI-Fc fusion protein is in a formulation comprising an acetic acid buffer having a pH of 4.0 to 6.0, proline at a concentration of 1% to 10%, and a surfactant at a concentration of 0.005 to 0.05% (w/v) .

20. The use of claim 19, wherein the concentration of the TACI-Fc fusion protein in the formulation is 50 mg/mL to 200 mg/mL.

21. A formulation comprising a TACI-Fc fusion protein, an acetic acid buffer having a pH of 4.0 to 6.0, proline at a concentration of 1% to 10%, and a surfactant at a concentration of 0.005 to 0.05% (w/v), wherein the TACI-Fc fusion protein is a homodimer of two polypeptides of the formula TACI-linker-Fc, wherein TACI is a variant TACI polypeptide comprising the amino acid substitutions K77E, F78Y and Y102D with reference to the amino acid sequence set forth in SEQ ID NO:13, wherein the amino acid position numbering corresponds to that of SEQ ID NO: 122.

22. The formulation of claim 21, wherein the variant TACI polypeptide comprises the amino acid sequence set forth in SEQ ID NO:26.

23. The formulation of claim 21 or claim 22, wherein
a) the linker is selected from GSGGS (SEQ ID NO: 76), GGGGS (G4S; SEQ ID NO: 77), GSGGGGS (SEQ ID NO: 74), GGGGSGGGGS (2xGGGGS; SEQ ID NO: 78), GGGGSGGGGSGGGGS (3xGGGGS; SEQ ID NO: 79), GGGGSGGGGSGGGGSGGGGS (4xGGGGS, SEQ ID NO:84), GGGGSGGGGSGGGGSGGGGSGGGGS (5xGGGGS, SEQ ID NO: 91), GGGGSSA (SEQ ID NO: 80), or GSGGGGSGGGGS (SEQ ID NO:194) or combinations thereof, or
b) the linker is set forth in SEQ ID NO: 74.

24. The formulation of any of claims 21-23, wherein the Fc is an IgG1 Fc domain or a variant IgG1 Fc domain that exhibits reduced binding affinity to an Fc receptor and/or reduced effector function as compared to a wild-type IgG1 Fc domain.

25. The formulation of claim 24, wherein the variant IgG1 Fc domain comprises one or more amino acid substitutions selected from L234A, L234V, L235A, L235E, G237A, S267K, R292C, N297G, and V302C, by EU numbering.

26. The formulation of any of claim 24 or claim 25, wherein the variant IgG1 Fc domain comprises the amino acid substitution C220S, wherein the residues are numbered according to the EU index of Kabat.

27. The formulation of any of claims 24-26, wherein the variant IgG1 Fc domain lacks the hinge sequence EPKSS or EPKSC.

28. The formulation of any of claims 24-27, wherein the variant IgG1 Fc domain comprises K447del, wherein the residue is numbered according to the EU index of Kabat.

29. The formulation of any of claims 21-26 and 28, wherein the Fc comprises the amino acid sequence set forth in SEQ ID NO:73.

30. The formulation of any of claims 21-26, 28, and 29, wherein the TACI-Fc fusion protein comprises the amino acid sequence set forth in SEQ ID NO: 167.

31. The formulation of any of claims 21-24, or 26-28, wherein the Fc comprises the amino acid sequence set forth in SEQ ID NO:81.

32. The formulation of any of claims 21-24, 26-28, and 31, wherein the TACI-Fc fusion protein comprises the amino acid sequence set forth in SEQ ID NO: 168.

33. The formulation of any of claims 21-32, wherein: (a) the formulation has a pH of 5.2, (b) the proline is at a concentration of 2% to 5%, (c) the surfactant is at a concentration of from 0.01 to 0.025% (w/v), (d) the surfactant is polysorbate 80, (e) wherein the concentration of the TACI-Fc fusion protein is between about 50 mg/mL and about 200 mg/mL such as at or about 100 mg/mL, or a combination of (a)-(e).

34. The formulation of any of claims 21-33 that is a liquid formulation.

35. A container comprising the formulation of any of claims 21-34.
36. The container of claim 35, wherein the container is a glass vial or a pre-filled syringe.
37. The container of claim 35 or claim 36, wherein the container holds a volume of up to 2 mL or up to 5 mL.
38. Use of a formulation of any of claims 21-34 in the manufacture of a medicament for reducing an immune response in a subject, wherein reducing the immune response is for treating a disease, disorder or condition in the subject.
39. The use of claim 38, wherein the immune response is a B cell immune response and the reducing of the immune response includes reducing or inhibiting B cell maturation, differentiation and/or proliferation in the subject.
40. Use of a formulation of any of claims 21-34 in the manufacture of a medicament for treating a disease, disorder or condition in a subject.
41. The use of claim 40, wherein the disease, disorder or condition is an autoimmune disease, an inflammatory condition, a B cell cancer, myeloma, autoantibody-associated glomerular disease, immunoglobulin (Ig) A nephropathy (IgAN), lupus nephritis (LN), primary membranous nephropathy (pMN), renal anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (AAV), a renal disease, a graft rejection, graft versus host disease, or a viral infection.
42. The use of claim 41, wherein the disease, disorder or condition is Systemic lupus erythematosus (SLE), Sjögren's syndrome, scleroderma, Multiple sclerosis, diabetes, polymyositis, primary biliary cirrhosis, IgA nephropathy, IgA vasculitis, optic neuritis, amyloidosis, antiphospholipid antibody syndrome (APS), autoimmune polyglandular syndrome type II (APS II), autoimmune thyroid disease (AITD), Graves' disease, autoimmune adrenalitis, or pemphigus vulgaris.
