ABSTRACT

TRANSPORT REFRIGERATION EQUIPMENT CONNECT TO WI-FI NETWORKS FOR DATA TRANSMISSION TO BACKEND

Provided are embodiments for a method and system for managing equipment connections to Wi-Fi networks for data transmission to backend systems. The embodiments can include determining a location of a first container, and transmitting credential information to a controller of the first container over a first connection based on the determined location. Embodiments can also include receiving an acknowledgment from the first container over the first connection, and enabling communication with the first container over a second connection using the credential information, wherein the first connection is different than the second connection.
