(54) Title: METHOD OF MANUFACTURING A BLOOD PUMP

FIG 4

(57) Abstract: An intravascular blood pump (P) comprises a pumping device (1) including an impeller (6) and an electric motor for driving the impeller (6). A rotor (7) of the electric motor is rotatable about an axis of rotation and coupled to the impeller (6) so as to be able to cause rotation of the impeller (6). An outer sleeve (13) forms a casing of the pumping device (1), wherein stator components are fixed inside the outer sleeve (13) by means of a casting compound (18). In a method of manufacturing the blood pump (P) the stator components are placed on a molding base (30), including the outer sleeve (13) to thereby form an interspace (19) between the molding base (30) and the outer sleeve (13) in which the stator components are disposed. The casting compound (18) is then injected into the interspace (19) via the molding base to fix the stator components inside the outer sleeve (13). The outer sleeve (13) preferably comprises a magnetically conductive material to form a yoke of the electric motor.
