

DATA TABLE PROCESSING

ABSTRACT

Provided in the present application are a data table processing method and apparatus, and a device and a computer program product. The data table processing method comprises: acquiring a first data table and a second data table, wherein the first data table and the second data table are both stored in a plurality of distributed partitions, and the first data table and the second data table comprise the same attribute items; extending the second data table on the basis of the attribute items in the first data table, so as to obtain a second extended table; extending the first data table on the basis of the attribute items in the second data table, so as to obtain a first extended table; adding a data column to the first extended table, so as to obtain an adjusted extended table; and associating the second extended table with the adjusted extended table, so as to obtain an associated data table corresponding to the first data table and the second data table.
