

ABSTRACT

PROCESSING METHOD OF THIN FILM SEALING LAYER

5 Disclosed is a processing method of a thin film sealing layer. In the method, a step of forming longitudinal through-corrugations and forming a bulge region includes: raising material pressing components and keeping a pair of slide components away from each other; placing a blank plate between the material pressing components and the slide components, and driving the material pressing components downward so that the blank plate is tightly pressed between the
10 material pressing components and the slide components; and operating a driving mechanism so that the pair of slide components are close to each other at a first predetermined speed while a shaping block moves downward at a second predetermined speed.
