

ABSTRACT

ALERT OUTPUT APPARATUS, ALERT OUTPUT METHOD, AND NON-TRANSITORY RECORDING MEDIUM

5 An alert output apparatus is configured to hold: image information indicating one or more inspection objects included in a photographic object of an image for which determination is to be executed; alert target item information indicating an alert target item; and co-occurrence item information indicating alert co-occurrence items each determined in advance
10 as an item to be included in the image at the same time as the alert target item, and to output alert when determining that at least one inspection object out of the one or more inspection objects matches to the alert target item and satisfies a given condition, and when determining that no inspection object out of the one or more inspection objects matches to the alert target item but
15 at least one inspection object out of the one or more inspection objects matches to at least one of the alert co-occurrence items.
