

ABSTRACT

The present disclosure discloses a method and apparatus for presenting a conversation message, relates to a technical field of computers, with a main objective to merge repeated and useless messages and present the merged message, so that a user can quickly view useful conversation messages to improve the conversation interaction experience of the user. The main technical solution of the present disclosure is: receiving a to-be-presented conversation message; judging whether the number of conversation messages with the same content as the to-be-presented conversation message in a presentation interface is larger than a threshold value; and merging the to-be-presented conversation message with the conversation messages with the same content and presenting the merged conversation message, if the number is larger than the threshold value. The present disclosure is mainly used for presenting the conversation message.
