(54) Title: MEDICATION DISPENSER AND CARRIER THEREFOR

(57) Abstract: The specification describes a medication dispenser for receiving a pressurised medication container and discharging therapeutic doses therefrom. The medication dispenser comprises an elongate tubular body (11) with a cavity formed in the body and adapted to receive a medication container. Lateral aperture (19) is formed in the body and communicates with the cavity. A sleeve (12) is rotatably mounted to a first end region (13) of the medication dispenser. The sleeve (12) has a sleeve aperture (16) which moves into and out of alignment with the lateral aperture (19) during rotation of the sleeve. A mouthpiece (18) moves between a discharge position and a storage position with rotation of the sleeve. The tubular body has a longitudinal axis (22) which deviates away from the position of the extended mouthpiece, the deviation occurring outside the first end region (13). The invention may extend to a carrier (60) for use with the medication dispenser (10).
