

ABSTRACT

EQUIPMENT SELECTION ASSISTANCE APPARATUS AND PROGRAM

A monitoring system (10) includes an operation record information storage unit (21) to accumulate operation record information about an operating state of equipment (2) collected by an operation record information collection unit (11); an operation model generation unit (12) to generate, for each piece of the equipment, an operation model indicating an operating state of each piece of the equipment (2) based on the operation record information; and an equipment selection processing unit (13) to cause a user interface unit (14) to display operation models, and select the equipment (2) corresponding to an operation model selected by an administrator from the displayed operation models, as control target equipment to be a target of demand control.
