

ABSTRACT

The present invention provides a photocurable composition that exhibits favorable adhesion force to an adherend, and favorable durability upon compression of a
5 cured product thereof.

The present invention is a photocurable composition containing the following components (A) to (D), wherein a content of a monomer having an alicyclic structure and a (meth)acryloyl group is 6 to 20 mass% based on 100 mass% of a
10 total amount of the component (C):

component (A): a polyisobutylene compound having a (meth)acryloyl group in a molecule;

component (B): a urethane-modified (meth)acrylate oligomer, excluding the component (A);

15 component (C): a monomer having a (meth)acryloyl group, excluding the component (A) and the component (B); and

component (D): a photoinitiator.
