

## ABSTRACT

A film-like transparent adhesive is a thermosetting and energy ray curable film-like  
5 transparent adhesive and has a light transmittance of 80% or more at a wavelength of 800  
nm after curing. All the light transmittances at wavelengths of 800 to 2,000 nm after  
curing are preferably 80% or more and the light transmittance at a wavelength of 850 nm  
after curing was preferably 90% or more.
