

AN EMERGENCY ALARM SYSTEM FOR CONFINED SPACES

ABSTRACT OF THE DISCLOSURE

A signalling system for generating an emergency alarm or alert between a confined area and outside of the confined area. The outside portion of the system generates a wireless signal, for instance an FM signal, and transmits to one or more portable units carried by personnel inside the confined area. Audible and visual emergency signals are generated and transmitted to all personnel in the confined area if any sector in that area experiences an emergency.
