

ABSTRACT

METHOD FOR PROVIDING VEHICLE SERVICE

There is vehicle service providing device for controlling a first client that controls a
5 first vehicle number recognizer using a first vehicle number recognizing method and a second
client that controls a second vehicle number recognizer using a second vehicle number
recognizing method. The vehicle service providing device includes: a message acquisition
unit configured to obtain a message transmitted/received between an operating system (OS)
of the first client and a control program of the first client wherein the message is generated
10 from the OS or the control program according to an event occurring from the first client and
transmitted/received between a message queue of the OS and a message queue of the control
program; and an information extraction unit configured to analyze the message based on
information on a structure of the message and extract information on a target vehicle
recognized by the first vehicle number recognizer from the analyzed message.
