(54) Title: SYSTEM AND METHOD FOR COORDINATING NETWORKED RESOURCES

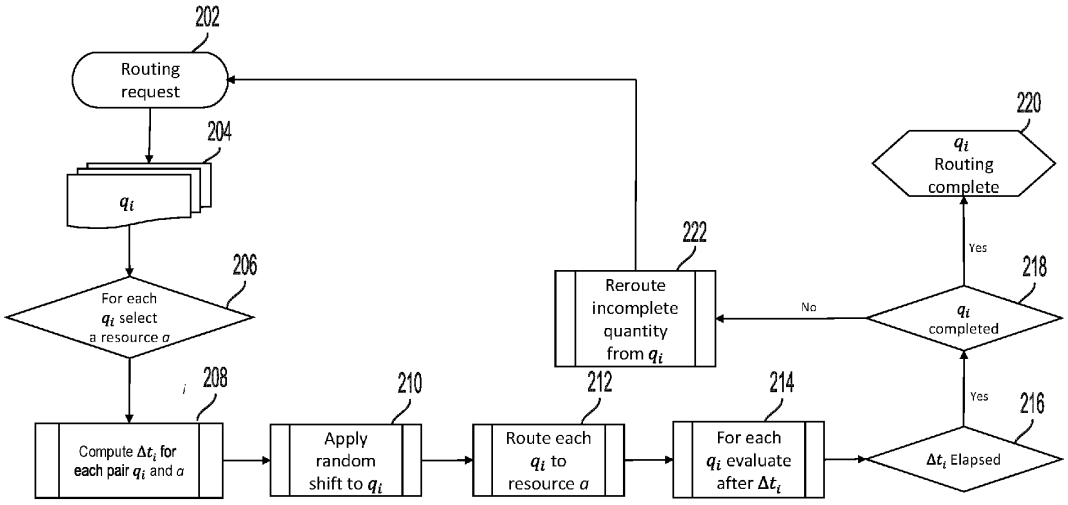

FIG. 4

(57) Abstract: Systems, methods, and devices for coordinating data processing using multiple networked resources are provided. An electronic registry of networked resources is maintained. A data processing request is received. The request is divided among a plurality of data processing segments. For at least one given data processing segment of the plurality of data processing segments: a networked resource is selected from the registry of networked computing. The selecting based on at least one of: a metric indicating suitability of the selected networked resource for the given data processing segment; and an output of a random number generator. A time-out duration is set for completion of processing of the given data processing segment at the selected networked resource. The given data processing segment is routed to the selected networked resource.
