

Multimedia Material Processing Method, Apparatus, And Multimedia Playback Device

ABSTRACT

Implementations of the present specification relate to a multimedia material
5 processing method, and apparatus, and a media playback device. The processing
method includes: obtaining a cache list sent by a service device, where the cache list
indicates a to-be-cached multimedia material; caching the to-be-cached multimedia
material; requesting the service device to determine a target multimedia material,
where the target multimedia material is a to-be-played multimedia material; and
10 re-determining the target multimedia material from the cached multimedia material if
the target multimedia material fails to be determined or the target multimedia material
is successfully determined but the target multimedia material is not cached.
