

BLOCKCHAIN-BASED MUSIC ORIGINALITY ANALYSIS METHOD AND APPARATUS

ABSTRACT

One or more implementations of the present specification provide a blockchain-based music originality analysis method and apparatus. In an implementation, a music file published on a blockchain network comprising a music library node and a music analyzer node is obtained by the music library node. An originality analysis is performed by the music library node on the music file based on a local music library to obtain a first originality and analysis digest that is used to indicate an originality and analysis result. The music library node publishes the first originality and analysis digest to the blockchain network to record and authenticate the originality and analysis result. The music analyzer node obtains and summarizes the first originality and analysis digest to obtain a second originality and analysis digest and performs processing of a service related to originality of the music file based on the second originality and analysis digest.
