

ABSTRACT

A method and apparatus for determining a drug code, relating to the technical field of artificial intelligence. The method comprises: obtaining a specification text of a drug (201); extracting drug key information in the specification text (202); obtaining, on the basis of a pre-created code inverted index, at least one code related to the drug key information and an ingredient corresponding to each code (203); and screening the at least one code on the basis of the drug key information and the ingredient corresponding to each code to obtain an anatomical therapeutic chemical classification system code of the drug (204). The method improves the efficiency of searching for the code for the drug.
