

THE DESCRIPTIONNOVEL FUSED HETEROCYCLIC DERIVATIVES USEFUL AS c-MET TYROSINE KINASE  
INHIBITORS

## Technical Field

This invention relates to certain novel fused quinazoline derivatives as c-Met inhibitors, their synthesis and their use for treating a c-Met mediated disorder. More particularly, this invention is directed to fused heterocyclic derivatives useful as inhibitors of c-Met, methods for producing such compounds and methods for treating a c-Met-mediated disorder.

## Background Art

The study of signal transduction pathways in normal and pathological states is of considerable interest because of the potential therapeutic benefit arising from new molecular agents targeting certain of these pathways associated with disease.

Receptor tyrosine kinases (RTKs) are key enzymes in signal transduction pathways that catalyse the autophosphorylation of tyrosine residues within the cytosolic, C-terminal domain of the protein. This generates docking sites for the recruitment of downstream proteins and the subsequent propagation of signals involved in an array of cellular events including growth, proliferation and survival. More generally deregulated kinase signalling is implicated in a diverse range of pathological states including immunological and inflammatory disorders, cardiovascular and neurodegenerative disease. The known receptor tyrosine kinases encompass 20 families and many are oncogenes (Blume- Jensen P et al. 2001. Nature 411 355-365). c-Met is the prototypic member of a subfamily of RTKs which includes the related proteins Ron (macrophage-stimulating protein receptor) and its chicken orthologue, Sea. The endogenous ligand is the growth and motility factor hepatocyte growth factor (HGF, also known as Scatter Factor). c-Met and HGF are expressed in a range of tissue types although their expression is normally restricted to cells of epithelial and mesenchymal origin. In contrast, tumour cells often express constitutively activated c-Met.

There is now a growing body of compelling evidence from both animal studies and cancer

patients that HGF-Met signalling plays an important role in the development and progression of malignancy and is associated in particular with invasive phenotypes. c-Met and HGF are highly expressed relative to surrounding tissue in numerous cancers and their expression correlates with poor patient prognosis (Jiang, W et al. 1999 Crit. Rev. Oncol. -hematol., 29, 209-248.) Activating point mutations in the kinase domain of c-Met are implicated in the cause of sporadic and hereditary forms of papillary renal carcinoma (Danilkovitch-Miagkova, A et al 2002. 1 J. Clin. Invest. 109, 863-867). c-Met is a marker for both cancer and malignancy and agents that inhibit c-Met-HGF signalling can be expected to ameliorate disease progression in relevant cancers.

Conventional procedures for the selection and preparation of suitable prodrug derivatives are described, for example, in"Design of Prodrugs", ed. H. Bundgaard, Elsevier, 1985.

It is intended that the definition of any substituent or variable at a particular location in a molecule be independent of its definitions elsewhere in that molecule. It is understood that substituents and substitution patterns on the compounds of this invention can be selected by one

of ordinary skill in the art to provide compounds that are chemically stable and that can be readily synthesized by techniques known in the art as well as those methods set forth herein.

Such acids include, for example, acetic, benzenesulfonic, benzoic, camphorsulfonic, citric, ethanesulfonic, formic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, pamoic, pantothenic, phosphoric, succinic, sulfuric, tartaric, p-toluenesulfonic acid and the like. Preferred are citric, hydrobromic, formic, hydrochloric, maleic, phosphoric, sulfuric and tartaric acids. Particularly preferred are formic and hydrochloric acid. Since the compounds of Formula (I) are intended for pharmaceutical use they are preferably provided in substantially pure form, for example at least 60% pure, more suitably at least 75% pure especially at least 98% pure (% are on a weight for weight basis).

The pharmaceutical compositions of the present invention comprise a compound represented by Formula I (or a pharmaceutically acceptable salt thereof) as an active ingredient, a pharmaceutically acceptable carrier and optionally other therapeutic ingredients or adjuvants. The compositions include compositions suitable for oral, rectal, topical, and parenteral (including subcutaneous, intramuscular, and intravenous) administration, although the most suitable route in any given case will depend on the particular host, and nature and severity of the conditions for which the active ingredient is being administered. The pharmaceutical compositions may be conveniently presented in unit dosage form and prepared by any of the methods well known in the art of pharmacy.

In practice, the compounds represented by Formula I, or a prodrug, or a metabolite, or a pharmaceutically acceptable salts thereof, of this invention can be combined as the active ingredient in intimate admixture with a pharmaceutical carrier according to conventional

pharmaceutical compounding techniques. The carrier may take a wide variety of forms depending on the form of preparation desired for administration, e.g., oral or parenteral (including intravenous). Thus, the pharmaceutical compositions of the present invention can be presented as discrete units suitable for oral administration such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient. Further, the compositions can be presented as a powder, as granules, as a solution, as a suspension in an aqueous liquid, as a non-aqueous liquid, as an oil-in-water emulsion, or as a water-in-oil liquid emulsion. In addition to the common dosage forms set out above, the compound represented by Formula I, or a pharmaceutically acceptable salt thereof, may also be administered by controlled release means and/or delivery devices. The compositions may be prepared by any of the methods of pharmacy. In general, such methods include a step of bringing into association the active ingredient with the carrier that constitutes one or more necessary ingredients. In general, the compositions are prepared by uniformly and intimately admixing the active ingredient with liquid carriers or finely divided solid carriers or both. The product can then be conveniently shaped into the desired presentation.

Thus, the pharmaceutical compositions of this invention may include a pharmaceutically acceptable carrier and a compound, or a pharmaceutically acceptable salt, of Formula I. The compounds of Formula I, or pharmaceutically acceptable salts thereof, can also be included in pharmaceutical compositions in combination with one or more other therapeutically active compounds.

The pharmaceutical carrier employed can be, for example, a solid, liquid, or gas. Examples of solid carriers include lactose, terra alba, sucrose, talc, gelatin, agar, pectin, acacia, magnesium stearate, and stearic acid. Examples of liquid carriers are sugar syrup, peanut oil, olive oil, and water. Examples of gaseous carriers include carbon dioxide and nitrogen. In preparing the compositions for oral dosage form, any convenient pharmaceutical media may be employed. For example, water, glycols, oils, alcohols, flavoring agents, preservatives, coloring agents, and the like may be used to form oral liquid preparations such as suspensions, elixirs and solutions; while carriers such as starches, sugars, microcrystalline cellulose, diluents, granulating agents, lubricants, binders, disintegrating agents, and the like may be used to form oral solid preparations such as powders, capsules and tablets. Because of their ease of administration, tablets and

capsules are the preferred oral dosage units whereby solid pharmaceutical carriers are employed. Optionally, tablets may be coated by standard aqueous or nonaqueous techniques.

A tablet containing the composition of this invention may be prepared by compression or molding, optionally with one or more accessory ingredients or adjuvants. Compressed tablets may be prepared by compressing, in a suitable machine, the active ingredient in a free-flowing form such as powder or granules, optionally mixed with a binder, lubricant, inert diluent, surface active or dispersing agent. Molded tablets may be made by molding in a suitable machine, a mixture of the powdered compound moistened with an inert liquid diluent. Each tablet preferably contains from about 0.05mg to about 5g of the active ingredient and each cachet or capsule preferably containing from about 0.05mg to about 5g of the active ingredient. For example, a formulation intended for the oral administration to humans may contain from about 0.5mg to about 5g of active agent, compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95 percent of the total composition. Unit dosage forms will generally contain between from about 1mg to about 2g of the active ingredient, typically 25mg, 50mg, 100mg, 200mg, 300mg, 400mg, 500mg, 600mg, 800mg, or 1000mg.

Pharmaceutical compositions of the present invention suitable for parenteral administration may be prepared as solutions or suspensions of the active compounds in water. A suitable surfactant can be included such as, for example, hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, and mixtures thereof in oils. Further, a preservative can be included to prevent the detrimental growth of microorganisms.

Pharmaceutical compositions of the present invention suitable for injectable use include sterile aqueous solutions or dispersions. Furthermore, the compositions can be in the form of sterile powders for the extemporaneous preparation of such sterile injectable solutions or dispersions. In all cases, the final injectable form must be sterile and must be effectively fluid for easy syringability. The pharmaceutical compositions must be stable under the conditions of manufacture and storage; thus, preferably should be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (e.g., glycerol, propylene glycol and liquid polyethylene glycol), vegetable oils, and suitable mixtures thereof.

Pharmaceutical compositions of the present invention can be in a form suitable for topical use such as, for example, an aerosol, cream, ointment, lotion, dusting powder, or the like. Further, the compositions can be in a form suitable for use in transdermal devices. These formulations may be prepared, utilizing a compound represented by Formula I of this invention, or a pharmaceutically acceptable salt thereof, via conventional processing methods. As an example, a cream or ointment is prepared by admixing hydrophilic material and water, together with about 5wt% to about 10wt% of the compound, to produce a cream or ointment having a desired consistency.

Pharmaceutical compositions of this invention can be in a form suitable for rectal administration wherein the carrier is a solid. It is preferable that the mixture forms unit dose suppositories. Suitable carriers include cocoa butter and other materials commonly used in the art. The suppositories may be conveniently formed by first admixing the composition with the softened or melted carrier(s) followed by chilling and shaping in molds.

In addition to the aforementioned carrier ingredients, the pharmaceutical formulations described above may include, as appropriate, one or more additional carrier ingredients such as diluents, buffers, flavoring agents, binders, surface-active agents, thickeners, lubricants, preservatives (including antioxidants) and the like. Furthermore, other adjuvants can be included to render the formulation isotonic with the blood of the intended recipient. Compositions containing a compound described by Formula I, or pharmaceutically acceptable salts thereof, may also be prepared in powder or liquid concentrate form.

Generally, dosage levels on the order of from about 0.01mg/kg to about 150mg/kg of body weight per day are useful in the treatment of the above-indicated conditions, or alternatively about 0.5mg to about 7g per patient per day. For example, inflammation, cancer, psoriasis, allergy/asthma, disease and conditions of the immune system, disease and conditions of the central nervous system (CNS), may be effectively treated by the administration of from about 0.01 to 50mg of the compound per kilogram of body weight per day, or alternatively about 0.5mg to about 3.5g per patient per day.

It is understood, however, that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health, sex, diet, time of

administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

These and other aspects will become apparent from the following written description of the invention.

The compounds of Formula I inhibit the activity of tyrosine kinase enzymes in animals, including humans, and they are useful in the treatment and/or prevention of various diseases and conditions. In particular, compounds disclosed herein are inhibitors of kinases, in particular, but not limited to, c-MET, KDR, Tie-2, Flt3, FGFR3, Abl, Aurora A, c-Src, IGF-IR, ALK, c-MET, RON, PAK1, PAK2, and TAK1, and can be used in the treatment of proliferative diseases, such as, but not limited to, cancer. Since MET and RON kinases have been shown to play a role in the

EMT process, the compounds of Formula I are useful in the treatment and/or prevention of various diseases and conditions in which EMT is involved, for example, the treatment of conditions characterized by a dysregulation of EMT.

Specifically, the compounds of Formula I of the present invention are useful in the treatment of a variety of cancers, including, but not limited to, solid tumor, sarcoma, fibrosarcoma, osteoma, melanoma, retinoblastoma, rhabdomyosarcoma, glioblastoma, neuroblastoma, teratocarcinoma, hematopoietic malignancy, and malignant ascites. More specifically, the cancers include, but not limited to, lung cancer, bladder cancer, pancreatic cancer, kidney cancer, gastric cancer, breast cancer, colon cancer, prostate cancer (including bone metastases), hepatocellular carcinoma, ovarian cancer, esophageal squamous cell carcinoma, melanoma, an anaplastic large cell lymphoma, an inflammatory myofibroblastic tumor, and a glioblastoma.

In another embodiment, the present invention is directed to a pharmaceutical composition comprising a therapeutically effective amount of a compound of Formula I, or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier. The present invention is also directed to a method of treating a patient having a condition which is mediated by protein kinase activity by administering to the patient a therapeutically effective amount of the above-mentioned pharmaceutical composition.

As defined herein, the term "subject" refers to an animal, preferably a mammal, most preferably a human, who has been the object of treatment, observation or experiment. The term "therapeutically effective amounts used herein, means that amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease or disorder being treated.

The term "substituted", as defined herein, includes multiple substituents (e. g. , Phe, aryl, heteroalkyl, heteroaryl), preferably from one to five substituents, more preferably from one to three substituents, most preferably from one to two substituents, independently selected from the list of substituents.

The compounds of the present invention may have asymmetric carbon atoms. Such diastomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods known to those skilled in the art, for example, by chromatography or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixtures into a diastereomeric mixture by reaction with an appropriate optically active compound (e. g. , alcohol), separating the diastereomers and converting (e. g., hydrolyzing) the individual diastereomers to the corresponding pure enantiomers. All such isomers, including diastereomer mixtures and pure enantiomers are considered as part of the invention.

In general, the compounds of the present invention can be prepared according to Scheme 1 depicts general synthetic routes for compounds of the invention and are not intended to be limiting. More specifically, Scheme 1 depicts synthesis of quinazoline compounds, and quinoline compounds. Specific examples are described subsequently to these general synthetic

descriptions so as to allow one skilled in the art to make and use either quinazolines or quinolines of the invention.

Scheme 1 outlines the general procedures one could use to provide compounds of the present invention, for example Z is  $\text{NR}_3\text{R}_4$  in formula I.

Scheme 1

4-Chloro-6,7-dimethoxy-quinazoline (1a) or 4-Chloro-6,7-dimethoxy-quinoline (1b) is commercial available or been prepared by conventional methods known by those skilled in the art. In step 1 of Scheme 1, nucleophilic substitution of 1a or 1b with anilines 2a, phenols 2b or thiophenols 2c can be easily accomplished in the presence of an trialkylamine or alkali carbonation(e.g., triethylamine, potassium carbonate).

In step 2 of Scheme 1, both methyl protecting groups of intermediate 3 in 6 and 7 position are removed by treating the intermediate from step 1 with the appropriate reagents and procedures. For example, boron tribromide at 0°C for 1 hr and following 4 hr at room temperature.

In step 3 of Scheme 1, the fused heterocyclic ring is prepared by treatment of the diphenol intermediate 4 with the appropriate reagents such as 5 (the leaving group  $R_9$  is tosylate, bromide or iodide) with the existence of an trialkylamine or alkali carbonation (e.g., triethylamine, potassium carbonate). The selection of solvent and reaction temperature are important for high yields. DMF or DMSO would be a good choice as a solvent for this reaction.

In step 4 of Scheme 1, the reduction of nitro group is accomplished by hydrogenation using palladium on carbon as catalyst. Alternatively, Zinc powder or Iron powder reduction of nitro group also is available option.

The final step in Scheme 1, the final amides 9 can be prepared by coupling the aniline 7 with appropriate acids or corresponding acid chloride of 8 in the presence of base such as triethylamine, diisopropylethylamine. Coupling of aniline with acid 8 needs to use a coupling reagent, for example, HOBt, DCC.

Scheme 2

An alternative route for the key intermediates 7 is shown in Scheme 2. The coupling of 10 with anilines 11a, phenols 11b or thiophenols 11c yields the corresponding the key intermediates 7. The fused ring 4-Chloro-quinazoline (10a), 4-Chloro-quinoline (10b) or anilines 11a, phenols 11b or thiophenols 11c are commercial available, known in literature or may be conveniently prepared by a variety methods familiar to those skilled in the art.

cheme 3

S

An alternative route for the final products of Formula I is shown in Scheme 3. The coupling of 10 with anilines 12a, phenols 12b or thiophenols 12c yields the corresponding compounds of Formula I. The fused ring 4-Chloro-quinazoline (10a), 4-Chloro-quinoline (10b) or anilines 12a, phenols 12b or thiophenols 12c are commercial available, known in literature or may be conveniently prepared by a variety of methods familiar to those skilled in the art.

To prepare the pharmaceutical compositions of this invention, one or more compounds of Formula (I) or salt thereof as the active ingredient, is intimately admixed with a pharmaceutical carrier according to conventional pharmaceutical compounding techniques, which carrier may take a wide variety of forms depending on the form of preparation desired for administration (e. g. oral or parenteral). Suitable pharmaceutically acceptable carriers are well known in the art. Descriptions of some of these pharmaceutically acceptable carriers may be found in The Handbook of Pharmaceutical Excipients, published by the American Pharmaceutical Association and the Pharmaceutical Society of Great Britain. During any of the processes for preparation of the compounds of the present invention, it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J. F. W. McOmie, Plenum Press, 1973; and T. W. Greene & P. G. M. Wuts, Protective Groups in Organic Synthesis, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known in the art.

Administration of the active compounds can be effected by any method which enables delivery of the compounds to the site of action (e. g., cancer cells). These methods include oral routes, rectal routes, intraduodenal routes, parenteral injection (including intravenous, subcutaneous, intramuscular, intravascular or infusion), topical administration, etc. The amount of active compound administered will, of course, be dependent on the subject being treated, on the severity of the affliction, on the manner of administration and on the judgement of the prescribing physician. However an effective dosage is in the range of approximately 0.001 mg to about 300 mg (preferably, from about 0.01 mg to about 100mg; and, more preferably, from about 0.1 mg to about 30 mg) and may be given at a dosage of from about 0.001 mg/kg/day to about 300

mg/kg/day (preferably, from about 0.01 mg/kg/day to about 100 mg/kg/day; and, more preferably, from about 0.1 mg/kg/day to about 30 mg/kg/day).

The composition may, for example, be in a form suitable for oral administration such as a tablet, capsule, pill, powder, sustained release formulation, solution, or suspension; for parenteral injection such as a sterile solution, suspension or emulsion; or for topical administration such as an ointment or cream or for rectal administration as a suppository. The pharmaceutical composition may be in unit dosage forms suitable for single administration of precise dosages. The pharmaceutical composition will include a conventional pharmaceutical carrier or excipient and a compound according to the present invention as an active ingredient. In addition, it may include other medicinal or pharmaceutical agents, carriers, adjuvants, etc.

Exemplary parenteral administration forms include solutions or suspensions of active compounds in sterile aqueous solutions, for example aqueous propylene glycol or dextrose solutions. Such dosage forms can be suitably buffered, if desired.

Suitable pharmaceutical carriers include inert diluents or fillers, water and various organic solvents. The pharmaceutical compositions may, if desired, contain additional ingredients such as flavorings, binders, excipients and the like. Thus for oral administration, tablets containing various excipients, such as citric acid may be employed together with various disintegrants such as starch, alginic acid and certain complex silicates and with binding agents such as sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium lauryl sulfate and talc are often useful for tableting purposes.

Solid compositions of a similar type may also be employed in soft and hard filled gelatin capsules. Preferred materials, therefor, include lactose or milk sugar and high molecular weight polyethylene glycols. When aqueous suspensions or elixirs are desired for oral administration the active compound therein may be combined with various sweetening or flavoring agents, coloring matters or dyes and, if desired, emulsifying agents or suspending agents, together with diluents such as water, ethanol, propylene glycol, glycerin, or combinations thereof.

The therapeutic compounds may also be administered to a mammal other than a human. The dosage to be administered to a mammal will depend on the animal species and the disease or disorder being treated. The therapeutic compounds may be administered to animals in the form of a capsule, bolus, tablet or liquid drench. The therapeutic compounds may also be administered to

animals by injection or as an implant. Such formulations are prepared in a conventional manner in accordance with standard veterinary practice. As an alternative the therapeutic compounds may be administered with the animal feedstuff and for this purpose a concentrated feed additive or premix may be prepared for mixing with the normal animal feed.

An example of use of the invention is a method of treating a epidermal growth factor receptor (EGFR) tyrosine kinase or vascular endothelial growth factor receptor (VEGFR) tyrosine kinase mediated disorder in a subject in need thereof comprising administering to the subject a therapeutically effective amount of any of the compounds or pharmaceutical compositions described above. In a preferred embodiment, the method relates to the treatment of cancer such as brain, lung, squamous cell, bladder, gastric, pancreatic, breast, head, neck, oesophageal, prostate, colorectal, gynecological or thyroid cancer.

*4-(2-Fluoro-4-nitro-phenoxy)-7,8,10,11,13,14-hexahydro-6,9,12,15-tetraoxa-1-aza-cyclododeca[b]naphthalene*

To a round bottom flask equipped with a magnetic stir bar was added 7,8,10,11,13,14-Hexahydro-1H-6,9,12,15-tetraoxa-1-aza-cyclododeca[b]naphthalen-4-one (12.2g, 43.3mmol, 1.0eq.), acetonitrile (150ml), DMF (150ml) and cesium carbonate (28.2g, 86.5mmol, 2.0eq). The mixture was stirred at room temperature for 30 minutes at which time 1, 2-difluoro-4-nitro-benzene (7.57g, 47.6mmol, 1.1eq) was added over a 10 minute period. After 2 hours the reaction was complete at which time 75% of the MeCN and DMF was removed and the resulting solution was poured over into ice water. The solid was filtered and dried and further columned with a biotage system. The eluent was 1:3 ethyl acetate/hexane. Removal of the solvent afforded 4-(2-Fluoro-4-nitro-phenoxy)-7,8,10,11,13,14-hexahydro-6,9,12,15-tetraoxa-1-aza-cyclodo-deca[b]naphthalene as a pale green solid (7.4g, 41% yield).  $^1\text{H}$ -NMR (400MHz, DMSO): 8.58 (s, 1H), 7.80 (s, 1H), 7.50 (s, 1H), 7.04 (t, 1H), 6.88 (m, 1H), 6.50 (m, 2H), 4.35 (s, 4H), 3.87 (d, 4H), 3.62 (s, 4H). ## PHARMACOLOGICAL TESTING

The following assays demonstrate that certain compounds of the present invention potently inhibit c-Met phosphorylation in cells, potently inhibit c-Met in vivo, and demonstrate dose dependent anti-tumor activity in certain xenograft models.

### Biological Assays

The kinase domain (KD) of human c-Met (from Gly 966 to Ser 1390, NCBI NM\_000245) is cloned into a pFastBac<sup>123456789</sup>HT vector (Invitrogen, Carlsbad, CA). The His- c-Met KD construct is transposed into Baculovirus DNA using a Bac-to-Bac<sup>123456789</sup> system (Invitrogen). SF9 cells are infected with the recombinant baculovirus. The infected cells are harvested by centrifugation and the cell pellet is collected and stored at -80°C. Cells are lysed in buffer A

(40mM tris(hydroxymethyl)aminomethane (Tris), pH7.5, 500mM NaCl, 20% glycerol, and 10mM imidazole). Cell lysates are homogenized and centrifuged. Supernatants are incubated with nickel-nitrilotriacetic (Ni-NTA) resin and loaded onto a column. Proteins are eluted with buffer B (buffer A plus 0.3M imidazole) and c-Met containing fractions are pooled together, loaded onto a Superdex<sup>123456789</sup>200 column (Amershan Bioscience, Piscataway, NJ), eluted with buffer C (40mM Tris, pH7.5, 250mM NaCl, and 10% glycerol).

HGF Stimulated Met (pY1349) NCI-H460 Cell-based ELISA NCI-H460 cells (purchased from ATCC) are cultured in RPMI 1640 media (Invitrogen) supplemented with 10% Fetal Bovine Serum (FBS) and plated (prior to becoming 70% confluent) in 96-well flat-bottom plates at a density of 20,000 cells per well in 80μL volume. The cells are then incubated overnight in a cell culture incubator (5% CO<sub>2</sub>, 95% Relative Humidity (RH) and 37°C) and allowed to attach to the plate. The following morning the cells are washed with 2 volumes of a Reduced Serum Media (RSM) (RPMI 1640 media supplemented with 0.5% FBS). After removal of the last wash, 80μL of RSM is added to each well of the cell plates. The cell plates are incubated for 2.5 hours in a cell culture incubator, and then dosed with compounds. Compound inhibitors are first solubilized at 10mM in 100%DMSO and then diluted to 100μM with 2% DMSO RSM. Subsequently compound serial dilutions (1:3) are prepared over a 100μM to 0.005μM range. Cells are dosed with the addition of 20μL of compound stock to produce a final DMSO concentration of 0.4% and a final compound concentration dose range between 20 and 0.001μM. After dosing with compounds the cells plates are gently agitated to mix and then allowed to incubate for 30min in a cell culture incubator. After dose completion, the cells are stimulated with the addition of 20μL per well of Hepatocyte Growth Factor (HGF) at a final concentration of 100ng/mL in RSM (all wells except MIN wells are stimulated, MIN wells are dosed with 20μL RSM). After 10min incubation in a cell culture incubator, the liquid is removed from the cell plate wells, and the cells are lysed by the addition of 50μL of ice-cold Meso Scale Discovery<sup>123456789</sup> (MSD, Gaithersburg, Maryland) IX Lysis Buffer (150 mM NaCl, 20mM Tris, pH7.5, 1mM EDTA, 1mM ethylene glycol tetraacetic acid, and 1%TRITON<sup>123456789</sup> X-100) supplemented with Phosphatase I and II and Protease inhibitors (Sigma, St. Louis, MO). After lysis at RT for 30min the lysates are transferred to and captured on a MSD<sup>123456789</sup> Multi-Spot 96-well

4-spot PhosphoMet plate that is BSA-blocked (at 30mg/mL Block A in IX Tris Wash Buffer) and then washed one time with Tris Wash Buffer . After 2 hours capture (at RT) the lysates are removed from the MSD<sup>123456789</sup> plate and the plate is washed with IX Tris Wash Buffer. After blotting, 25 $\mu$ L of 5nM Sulfo-Tag Anti-Total Met antibody (detection antibody, MSD<sup>123456789</sup> prepared in IX Tris Wash Buffer supplemented with 10 mg/mL BSA and 0.1% Blocker D-R (MSD<sup>123456789</sup>)) is added to the wells of the MSD<sup>123456789</sup> plate. After 1 hour capture (at RT) the MSD<sup>123456789</sup> plate wells are washed with IX Tris Wash Buffer, and then 150 $\mu$ L of IX Read Buffer T (with surfactant, MSD<sup>123456789</sup>) is added. Immediately after the

addition of the Read Buffer, the plates are analyzed with a SECTOR 6000 MSD<sup>123456789</sup> Imager plate reader. Relative IC<sub>50</sub> values are determined using MSD activity units by calculating percent inhibition with respect to on-plate "MIN" and "MAX" controls and then fitting the percent inhibition values and ten-point dose response data to a four-parameter logistic equation. This assay has a Minimum Significant Ratio (MSR) of 2.06. For all exemplified compounds the IC<sub>50</sub> values are less than 0.2 $\mu$ M (Table1). For example, the average (n=6) IC<sub>50</sub> value (50% inhibitory concentration ) of Example 1 in this assay is 0.0352 $\mu$ M, indicating it potently inhibits c-Met phosphorylation in cells.

#### c-Met in vivo target inhibition assay

Sl 14 cells (licensed from PHS, over-express both human HGF and human c-Met) are cultured in a growth media (Dulbecco's Modified Eagle Medium) supplemented with 10% fetal calf serum and expanded. Cells are harvested and washed twice with phosphate buffered saline and 2X10<sup>6</sup> cells are mixed with equal volume of BD Matrigel™ matrix (BD Bioscience, Franklin, NJ), and injected subcutaneous ly into the flank of nude mice (athymic nude, from Harlan, Indianapolis, IN). At day 8 after implant, compounds (formulated in 10% acacia or 1% carboxymethylcellulose/0.5% sodium lauryl sulfate/0.05% antifoam as suspension) are administered to animals by oral gavage at 50mg/kg. Animals are sacrificed at 2 hours post dose, and tumors are harvested and stored frozen until needed.

Frozen tumors are pulverized using motar-pastel. The pulverized tissues are transferred to a tube containing Lysing Matrix D beads (MP Biomedicals, Solon, OH) and 600 $\mu$ L lysis buffer (RIPA buffer, containing 50mM Tris-HCl, pH7.4, 150mM NaCl, 1%NP-40, 0.5%sodium deoxycholate, 0.1%SDS, from Boston Bioproducts). A FastPrep<sup>123456789</sup> Cell Disrupter (MP Biomedicals) is used to disrupt the tissue and lyse the cells. Lysates are passed through a 20 gauge needle and transferred to a clean tube. Protein concentration is determined by Bradford method. Tumor lysates are loaded onto MSD<sup>123456789</sup> phosphor-Met ELISA plates and phosphor- c-Met level is determined using the same protocol as H460 cell-based ELISA. For all exemplified compounds the Sl 14 in vivo inhibition values are equal or greater than 50% at the dose of 50mg/kg. For example, Example 1 is a potent inhibitor of c-Met phosphorylation with an ED<sub>50</sub> value (dose that produces 50% inhibition in tumor of 2.9mg/kg, indicating it is a potent c-Met inhibitor in vivo.

Xenograft tumor models

Human glioblastoma cells U87MG, human gastric cancer cells MKN45, human non small cell lung cancer cells H441, and human renal carcinoma cells Caki-1 are expanded in culture, harvested, and injected subcutaneous ly onto the rear flank of athymic nude mice. Testing compound is prepared in an appropriate vehicle and is administered by oral gavage when tumors are established (7-21 days after implant). Tumor response is determined by tumor volume measurement performed twice a week during the course of treatment. Tumor volume inhibition (% growth inhibition) is calculated by comparing treated groups to a vehicle control group. Body weight is taken as a general measurement of toxicity. The Compound of Example 1 demonstrates excellent dose dependent anti-tumor activity in these models. For example, when dosed at 30 mg/kg (oral (PO), bi-daily (BID) x 35), Example 1 is able to cause 59% growth inhibition of U87MG tumors. At 60 mg/kg dose (PO, BIDx35), 82% growth inhibition is achieved. At 120mg/kg dose (PO, BID x3 5), 92% growth inhibition reaches.

c-Met relevant tumors and xenograft models c-Met overexpression is a common feature for many human tumors, including lung, breast, colorectal, gastric, renal, pancreatic, head and neck (1,2). c-Met activating mutations in the kinase domain are implicated as the cause for several tumors, such as hereditary papillary renal cell carcinoma, childhood hepatocellular carcinoma, and gastric cancer (3-7). c-Met inhibitors from Pfizer demonstrated antitumor efficacy in many human xenograft tumors, including U87MG, GTL16, H441, Caki-1, and PC3 (8).
