

ABSTRACT

The present invention includes: an EDI (100), a pump (200) that supplies water to be treated to the EDI (100), a pressure gauge (300) that measures the output pressure value of the water to be treated from the pump (200), and a control unit (400) that controls the discharge pressure of the pump (200) such that the output pressure value measured by the pressure gauge (300) at a predetermined timing becomes a predetermined value.
