

BLOCKCHAIN-BASED DATA PROCESSING METHOD AND DEVICE

ABSTRACT

One or more implementations of the present specification provide a
5 blockchain-based data processing method and device that are applied to a data center
connected to the blockchain. The method includes: synchronizing block data in the
blockchain to a local database; receiving a data use request sent by a target application;
and in response to the data use request, querying the local database for requested data
corresponding to the data use request, and returning the requested data to the target
10 application.
