

CONTENT CONTAINER

【Abstract】

According to an embodiment of the present disclosure, a content container is
5 provided. The content container may include: a container part configured to accommodate a
liquid content; an upper cap that is detachably coupled to the container part and includes a
first accommodation part configured to accommodate a solid content and a pressing part
moved by being pressed; and a lower cap that is inserted into the container part, and includes
10 an accommodation tube forming a second accommodation part and a plurality of
communication holes formed in the outside of the accommodation tube to communicate with
the container part, wherein, by pressing the upper cap, the solid content is moved from the
first accommodation part to the second accommodation part.
