

METHOD FOR PRODUCING POLYDIENES AND POLYDIENE COPOLYMERS WITH REDUCED COLD FLOW

FIELD OF THE INVENTION

[0001] One or more embodiments of the present invention relate to methods for coupling polydienes or polydiene copolymers. The resultant coupled polymers of certain embodiments exhibit advantageous cold-flow resistance and improved dynamic properties.

BACKGROUND OF THE INVENTION

[0002] Synthetic elastomers having a linear backbone are often employed in the manufacture of tire components, such as sidewalls and treads. It is believed that these polymers provide advantageous tensile properties, abrasion resistance, low hysteresis, and fatigue resistance. For example, cis-1,4-polydienes have been used in tires. These polymers can be produced by using lanthanide-based catalyst systems, which results in the formation of polymers characterized by a linear backbone. Polydienes having low or medium cis-1,4-linkage contents and polydiene copolymers, such as random copolymers of butadiene, styrene, and optionally isoprene, are also often employed in tires. These polymers can generally be produced by employing anionic initiators, such as n-butyllithium, which yields polymers with a linear backbone.

[0003] While synthetic elastomers having a linear backbone demonstrate a number of advantageous properties, especially for use in tires, these polymers exhibit cold flow due to their linear backbone structures. In other words, the polymers with linear backbones flow under their own weight, which causes problems when attempting to transport or store the polymers. Conventionally, especially with anionically-polymerized polymers, the cold flow issues can be alleviated through polymer coupling. Polymer coupling, however, presents several technological challenges. For example, the benefits associated with a reduction in cold flow must be balanced with the processability of the polymers during compounding. Also, the ability to react certain compounds or reagents with a polymer chain, especially the

reactive end of a polymer chain, can be unpredictable. Still further, it can be difficult to predict whether any particular coupling agent may have a deleterious impact upon one or more of the properties sought from the polymer and/or its use within particular compositions, such as those employed in the manufacture of tire components.

[0004] Because there is a need to reduce the cold flow of synthetic elastomers without having a deleterious impact on the processability and/or use of the polymers, especially in the manufacture of tire components, there exists a need to develop new coupling agents and methods for coupling polymers.

SUMMARY OF THE INVENTION

[0005] One or more embodiments of the present invention provide a method for preparing a coupled polymer, the method comprising the steps of: (i) polymerizing monomer to form a reactive polymer; (ii) reacting the reactive polymer with a polyisocyanate having a functionality of X to form an intermediate polymer product; and (iii) reacting the intermediate polymer product with a polyol having a functionality of Y to form the coupled polymer product, where $X+Y \geq 5$.

[0006] One or more embodiments of the present invention further provide a method for preparing a coupled polymer, the method comprising the steps of: (i) polymerizing conjugated diene monomer, and optionally monomer copolymerizable therewith, to form polymer having a reactive chain end; (ii) reacting the reactive chain end of the polymer with a polyisocyanate having a functionality of X to form an intermediate polymer product; and (iii) reacting the intermediate polymer product with a polyol having a functionality of Y to form the coupled polymer product, where $X+Y \geq 5$.

[0007] One or more embodiments of the present invention further provide coupled polymer defined by the formula:

where R^{10} is a multivalent organic group deriving from the triol, R^{11} is a divalent organic group deriving from the diisocyanate, and each R^{12} is a polymer chain.

DETAILED DESCRIPTION OF ILLUSTRATIVE EMBODIMENTS

[0008] According to one or more embodiments of the present invention, a reactive polymer is prepared by polymerizing conjugated diene monomer and optionally monomer copolymerizable therewith, and this reactive polymer is then reacted with a polyisocyanate to form an intermediate polymer product followed by a reaction with a polyol to form a coupled polymer. In other words, the process of the present invention includes a sequential reaction that ultimately produces a coupled polymer. The resultant coupled polymers can be used in the manufacture of tire components. In one or more embodiments, the resultant coupled polymers exhibit advantageous cold flow resistance and can be used to prepare vulcanizates having advantageous dynamic properties.

POLYMER FORMATION

[0009] Examples of conjugated diene monomer include 1,3-butadiene, isoprene, 1,3-pentadiene, 1,3-hexadiene, 2,3-dimethyl-1,3-butadiene, 2-ethyl-1,3-butadiene, 2-methyl-1,3-pentadiene, 3-methyl-1,3-pentadiene, 4-methyl-1,3-pentadiene, and 2,4-hexadiene. Mixtures of two or more conjugated dienes may also be utilized in copolymerization.

[0010] Examples of monomer copolymerizable with conjugated diene monomer include vinyl-substituted aromatic compounds such as styrene, *p*-methylstyrene, α -methylstyrene, and vinylnaphthalene.

COORDINATION POLYMERIZATION

[0011] In one or more embodiments, the reactive polymer is prepared by coordination polymerization, wherein monomer is polymerized by using a coordination catalyst system. The key mechanistic features of coordination polymerization have been discussed in books (e.g., Kuran, W., *Principles of Coordination Polymerization*; John Wiley & Sons: New York, 2001) and review articles (e.g., Mulhaupt, R., *Macromolecular Chemistry and Physics* 2003, volume 204, pages

289-327). Coordination catalysts are believed to initiate the polymerization of monomer by a mechanism that involves the coordination or complexation of monomer to an active metal center prior to the insertion of monomer into a growing polymer chain. An advantageous feature of coordination catalysts is their ability to provide stereochemical control of polymerizations and thereby produce stereoregular polymers. As is known in the art, there are numerous methods for creating coordination catalysts, but all methods eventually generate an active intermediate that is capable of coordinating with monomer and inserting monomer into a covalent bond between an active metal center and a growing polymer chain. The coordination polymerization of conjugated dienes is believed to proceed via π -allyl complexes as intermediates. Coordination catalysts can be one-, two-, three- or multi-component systems. In one or more embodiments, a coordination catalyst may be formed by combining a heavy metal compound (e.g., a transition metal compound or a lanthanide-containing compound), an alkylating agent (e.g., an organoaluminum compound), and optionally other co-catalyst components (e.g., a Lewis acid or a Lewis base). In one or more embodiments, the heavy metal compound may be referred to as a coordinating metal compound.

[0012] Various procedures can be used to prepare coordination catalysts. In one or more embodiments, a coordination catalyst may be formed in situ by separately adding the catalyst components to the monomer to be polymerized in either a stepwise or simultaneous manner. In other embodiments, a coordination catalyst may be preformed. That is, the catalyst components are pre-mixed outside the polymerization system either in the absence of any monomer or in the presence of a small amount of monomer. The resulting preformed catalyst composition may be aged, if desired, and then added to the monomer that is to be polymerized.

[0013] Useful coordination catalyst systems include lanthanide-based catalyst systems. These catalyst systems may advantageously produce cis-1,4-polydienes that, prior to quenching, have reactive chain ends and may be referred to as pseudo-living polymers. While other coordination catalyst systems may also be employed, lanthanide-based catalysts have been found to be particularly advantageous, and

therefore, without limiting the scope of the present invention, will be discussed in greater detail.

[0014] Practice of the present invention is not necessarily limited by the selection of any particular lanthanide-based catalyst system. In one or more embodiments, the catalyst systems employed include (a) a lanthanide-containing compound, (b) an alkylating agent, and (c) a halogen source. In other embodiments, a compound containing a non-coordinating anion or a non-coordinating anion precursor can be employed in lieu of a halogen source. In these or other embodiments, other organometallic compounds, Lewis bases, and/or catalyst modifiers can be employed in addition to the ingredients or components set forth above. For example, in one embodiment, a nickel-containing compound can be employed as a molecular weight regulator as disclosed in U.S. Patent No. 6,699,813, which is incorporated herein by reference.

[0015] As mentioned above, the lanthanide-based catalyst systems employed in the present invention can include a lanthanide-containing compound. Lanthanide-containing compounds useful in the present invention are those compounds that include at least one atom of lanthanum, neodymium, cerium, praseodymium, promethium, samarium, europium, gadolinium, terbium, dysprosium, holmium, erbium, thulium, ytterbium, lutetium, and didymium. In one embodiment, these compounds can include neodymium, lanthanum, samarium, or didymium. As used herein, the term “didymium” shall denote a commercial mixture of rare-earth elements obtained from monazite sand. In addition, the lanthanide-containing compounds useful in the present invention can be in the form of elemental lanthanide.

[0016] The lanthanide atom in the lanthanide-containing compounds can be in various oxidation states including, but not limited to, the 0, +2, +3, and +4 oxidation states. In one embodiment, a trivalent lanthanide-containing compound, where the lanthanide atom is in the +3 oxidation state, can be employed. Suitable lanthanide-containing compounds include, but are not limited to, lanthanide carboxylates, lanthanide organophosphates, lanthanide organophosphonates,

lanthanide organophosphinates, lanthanide carbamates, lanthanide dithiocarbamates, lanthanide xanthates, lanthanide β -diketonates, lanthanide alkoxides or aryloxides, lanthanide halides, lanthanide pseudo-halides, lanthanide oxyhalides, and organolanthanide compounds.

[0017] In one or more embodiments, the lanthanide-containing compounds can be soluble in hydrocarbon solvents such as aromatic hydrocarbons, aliphatic hydrocarbons, or cycloaliphatic hydrocarbons. Hydrocarbon-insoluble lanthanide-containing compounds, however, may also be useful in the present invention, as they can be suspended in the polymerization medium to form the catalytically active species.

[0018] For ease of illustration, further discussion of useful lanthanide-containing compounds will focus on neodymium compounds, although those skilled in the art will be able to select similar compounds that are based upon other lanthanide metals.

[0019] Suitable neodymium carboxylates include, but are not limited to, neodymium formate, neodymium acetate, neodymium acrylate, neodymium methacrylate, neodymium valerate, neodymium gluconate, neodymium citrate, neodymium fumarate, neodymium lactate, neodymium maleate, neodymium oxalate, neodymium 2-ethylhexanoate, neodymium neodecanoate (a.k.a., neodymium versatate), neodymium naphthenate, neodymium stearate, neodymium oleate, neodymium benzoate, and neodymium picolinate.

[0020] Suitable neodymium organophosphates include, but are not limited to, neodymium dibutyl phosphate, neodymium dipentyl phosphate, neodymium dihexyl phosphate, neodymium diheptyl phosphate, neodymium dioctyl phosphate, neodymium bis(1-methylheptyl) phosphate, neodymium bis(2-ethylhexyl) phosphate, neodymium didecyl phosphate, neodymium didodecyl phosphate, neodymium dioctadecyl phosphate, neodymium dioleoyl phosphate, neodymium diphenyl phosphate, neodymium bis(p-nonylphenyl) phosphate, neodymium butyl (2-ethylhexyl) phosphate, neodymium (1-methylheptyl) (2-ethylhexyl) phosphate, and neodymium (2-ethylhexyl) (p-nonylphenyl) phosphate.

[0021] Suitable neodymium organophosphonates include, but are not limited to, neodymium butyl phosphonate, neodymium pentyl phosphonate, neodymium hexyl phosphonate, neodymium heptyl phosphonate, neodymium octyl phosphonate, neodymium (1-methylheptyl) phosphonate, neodymium (2-ethylhexyl) phosphonate, neodymium decyl phosphonate, neodymium dodecyl phosphonate, neodymium octadecyl phosphonate, neodymium oleyl phosphonate, neodymium phenyl phosphonate, neodymium (p-nonylphenyl) phosphonate, neodymium butyl butylphosphonate, neodymium pentyl pentylphosphonate, neodymium hexyl hexylphosphonate, neodymium heptyl heptylphosphonate, neodymium octyl octylphosphonate, neodymium (1-methylheptyl) (1-methylheptyl)phosphonate, neodymium (2-ethylhexyl) (2-ethylhexyl)phosphonate, neodymium decyl decylphosphonate, neodymium dodecyl dodecylphosphonate, neodymium octadecyl octadecylphosphonate, neodymium oleyl oleylphosphonate, neodymium phenyl phenylphosphonate, neodymium (p-nonylphenyl) (p-nonylphenyl)phosphonate, neodymium butyl (2-ethylhexyl)phosphonate, neodymium (2-ethylhexyl) butylphosphonate, neodymium (1-methylheptyl) (2-ethylhexyl)phosphonate, neodymium (2-ethylhexyl) (1-methylheptyl)phosphonate, neodymium (2-ethylhexyl) (p-nonylphenyl)phosphonate, and neodymium (p-nonylphenyl) (2-ethylhexyl)phosphonate.

[0022] Suitable neodymium organophosphinates include, but are not limited to, neodymium butylphosphinate, neodymium pentylphosphinate, neodymium hexylphosphinate, neodymium heptylphosphinate, neodymium octylphosphinate, neodymium (1-methylheptyl)phosphinate, neodymium (2-ethylhexyl)phosphinate, neodymium decylphosphinate, neodymium dodecylphosphinate, neodymium octadecylphosphinate, neodymium oleylphosphinate, neodymium phenylphosphinate, neodymium (p-nonylphenyl)phosphinate, neodymium dibutylphosphinate, neodymium dipentylphosphinate, neodymium dihexylphosphinate, neodymium diheptylphosphinate, neodymium dioctylphosphinate, neodymium bis(1-methylheptyl)phosphinate, neodymium bis(2-ethylhexyl)phosphinate, neodymium didecylphosphinate, neodymium didodecylphosphinate, neodymium

dioctadecylphosphinate, neodymium diolelphosphinate, neodymium diphenylphosphinate, neodymium bis(p-nonylphenyl) phosphinate, neodymium butyl (2-ethylhexyl) phosphinate, neodymium (1-methylheptyl)(2-ethylhexyl)phosphinate, and neodymium (2-ethylhexyl)(p-nonylphenyl)phosphinate.

[0023] Suitable neodymium carbamates include, but are not limited to, neodymium dimethylcarbamate, neodymium diethylcarbamate, neodymium diisopropylcarbamate, neodymium dibutylcarbamate, and neodymium dibenzylcarbamate.

[0024] Suitable neodymium dithiocarbamates include, but are not limited to, neodymium dimethyldithiocarbamate, neodymium diethyldithiocarbamate, neodymium diisopropyldithiocarbamate, neodymium dibutyldithiocarbamate, and neodymium dibenzylldithiocarbamate.

[0025] Suitable neodymium xanthates include, but are not limited to, neodymium methylxanthate, neodymium ethylxanthate, neodymium isopropylxanthate, neodymium butylxanthate, and neodymium benzylxanthate.

[0026] Suitable neodymium β -diketonates include, but are not limited to, neodymium acetylacetonate, neodymium trifluoroacetylacetonate, neodymium hexafluoroacetylacetonate, neodymium benzoylacetonate, and neodymium 2,2,6,6-tetramethyl-3,5-heptanedionate.

[0027] Suitable neodymium alkoxides or aryloxides include, but are not limited to, neodymium methoxide, neodymium ethoxide, neodymium isopropoxide, neodymium 2-ethylhexoxide, neodymium phenoxide, neodymium nonylphenoxide, and neodymium naphthoxide.

[0028] Suitable neodymium halides include, but are not limited to, neodymium fluoride, neodymium chloride, neodymium bromide, and neodymium iodide. Suitable neodymium pseudo-halides include, but are not limited to, neodymium cyanide, neodymium cyanate, neodymium thiocyanate, neodymium azide, and neodymium ferrocyanide. Suitable neodymium oxyhalides include, but are not limited to, neodymium oxyfluoride, neodymium oxychloride, and neodymium oxybromide. A Lewis base, such as tetrahydrofuran ("THF"), may be employed as an aid for

solubilizing this class of neodymium compounds in inert organic solvents. Where lanthanide halides, lanthanide oxyhalides, or other lanthanide-containing compounds containing a halogen atom are employed, the lanthanide-containing compound may also serve as all or part of the halogen source in the above-mentioned catalyst system.

[0029] As used herein, the term organolanthanide compound refers to any lanthanide-containing compound containing at least one lanthanide-carbon bond. These compounds are predominantly, though not exclusively, those containing cyclopentadienyl ("Cp"), substituted cyclopentadienyl, allyl, and substituted allyl ligands. Suitable organolanthanide compounds include, but are not limited to, Cp_3Ln , Cp_2LnR , Cp_2LnCl , CpLnCl_2 , $\text{CpLn}(\text{cyclooctatetraene})$, $(\text{C}_5\text{Me}_5)_2\text{LnR}$, LnR_3 , $\text{Ln}(\text{allyl})_3$, and $\text{Ln}(\text{allyl})_2\text{Cl}$, where Ln represents a lanthanide atom, and R represents a hydrocarbyl group. In one or more embodiments, hydrocarbyl groups useful in the present invention may contain heteroatoms such as, for example, nitrogen, oxygen, boron, silicon, sulfur, and phosphorus atoms.

[0030] As mentioned above, the lanthanide-based catalyst systems employed in the present invention can include an alkylating agent. In one or more embodiments, alkylating agents, which may also be referred to as hydrocarbylating agents, include organometallic compounds that can transfer one or more hydrocarbyl groups to another metal. Typically, these agents include organometallic compounds of electropositive metals such as Groups 1, 2, and 3 metals (Groups IA, IIA, and IIIA metals). Alkylating agents useful in the present invention include, but are not limited to, organoaluminum and organomagnesium compounds. As used herein, the term organoaluminum compound refers to any aluminum compound containing at least one aluminum-carbon bond. In one or more embodiments, organoaluminum compounds that are soluble in a hydrocarbon solvent can be employed. As used herein, the term organomagnesium compound refers to any magnesium compound that contains at least one magnesium-carbon bond. In one or more embodiments, organomagnesium compounds that are soluble in a hydrocarbon can be employed. As will be described in more detail below, several species of suitable alkylating agents can be in the form of a halide. Where the alkylating agent includes a halogen atom,

the alkylating agent may also serve as all or part of the halogen source in the above-mentioned catalyst system.

[0031] In one or more embodiments, organoaluminum compounds that can be utilized include those represented by the general formula $\text{AlR}_n\text{X}_{3-n}$, where each R independently can be a monovalent organic group that is attached to the aluminum atom via a carbon atom, where each X independently can be a hydrogen atom, a halogen atom, a carboxylate group, an alkoxide group, or an aryloxy group, and where n can be an integer in the range of from 1 to 3. In one or more embodiments, each R independently can be a hydrocarbyl group such as, for example, alkyl, cycloalkyl, substituted cycloalkyl, alkenyl, cycloalkenyl, substituted cycloalkenyl, aryl, substituted aryl, aralkyl, alkaryl, allyl, and alkynyl groups, with each group containing in the range of from 1 carbon atom, or the appropriate minimum number of carbon atoms to form the group, up to about 20 carbon atoms. These hydrocarbyl groups may contain heteroatoms including, but not limited to, nitrogen, oxygen, boron, silicon, sulfur, and phosphorus atoms.

[0032] Types of the organoaluminum compounds that are represented by the general formula $\text{AlR}_n\text{X}_{3-n}$ include, but are not limited to, trihydrocarbylaluminum, dihydrocarbylaluminum hydride, hydrocarbylaluminum dihydride, dihydrocarbylaluminum carboxylate, hydrocarbylaluminum bis(carboxylate), dihydrocarbylaluminum alkoxide, hydrocarbylaluminum dialkoxide, dihydrocarbylaluminum halide, hydrocarbylaluminum dihalide, dihydrocarbylaluminum aryloxy, and hydrocarbylaluminum diaryloxy compounds. In one embodiment, the alkylating agent can comprise trihydrocarbylaluminum, dihydrocarbylaluminum hydride, and/or hydrocarbylaluminum dihydride compounds. In one embodiment, when the alkylating agent includes an organoaluminum hydride compound, the above-mentioned halogen source can be provided by a tin halide, as disclosed in U.S. Patent No. 7,008,899, which is incorporated herein by reference in its entirety.

[0033] Suitable trihydrocarbylaluminum compounds include, but are not limited to, trimethylaluminum, triethylaluminum, triisobutylaluminum, tri-n-

propylaluminum, triisopropylaluminum, tri-n-butylaluminum, tri-t-butylaluminum, tri-n-pentylaluminum, trineopentylaluminum, tri-n-hexylaluminum, tri-n-octylaluminum, tris(2-ethylhexyl)aluminum, tricyclohexylaluminum, tris(1-methylcyclopentyl)aluminum, triphenylaluminum, tri-p-tolylaluminum, tris(2,6-dimethylphenyl)aluminum, tribenzylaluminum, diethylphenylaluminum, diethyl-p-tolylaluminum, diethylbenzylaluminum, ethyldiphenylaluminum, ethyldi-p-tolylaluminum, and ethyldibenzylaluminum.

[0034] Suitable dihydrocarbylaluminum hydride compounds include, but are not limited to, diethylaluminum hydride, di-n-propylaluminum hydride, diisopropylaluminum hydride, di-n-butylaluminum hydride, diisobutylaluminum hydride, di-n-octylaluminum hydride, diphenylaluminum hydride, di-p-tolylaluminum hydride, dibenzylaluminum hydride, phenylethylaluminum hydride, phenyl-n-propylaluminum hydride, phenylisopropylaluminum hydride, phenyl-n-butylaluminum hydride, phenylisobutylaluminum hydride, phenyl-n-octylaluminum hydride, p-tolyethylaluminum hydride, p-tolyl-n-propylaluminum hydride, p-tolyisopropylaluminum hydride, p-tolyl-n-butylaluminum hydride, p-tolyisobutylaluminum hydride, p-tolyl-n-octylaluminum hydride, benzylethylaluminum hydride, benzyl-n-propylaluminum hydride, benzylisopropylaluminum hydride, benzyl-n-butylaluminum hydride, benzylisobutylaluminum hydride, and benzyl-n-octylaluminum hydride.

[0035] Suitable hydrocarbylaluminum dihydrides include, but are not limited to, ethylaluminum dihydride, n-propylaluminum dihydride, isopropylaluminum dihydride, n-butylaluminum dihydride, isobutylaluminum dihydride, and n-octylaluminum dihydride.

[0036] Suitable dihydrocarbylaluminum halide compounds include, but are not limited to, diethylaluminum chloride, di-n-propylaluminum chloride, diisopropylaluminum chloride, di-n-butylaluminum chloride, diisobutylaluminum chloride, di-n-octylaluminum chloride, diphenylaluminum chloride, di-p-tolylaluminum chloride, dibenzylaluminum chloride, phenylethylaluminum chloride, phenyl-n-propylaluminum chloride, phenylisopropylaluminum chloride, phenyl-n-

butylaluminum chloride, phenylisobutylaluminum chloride, phenyl-n-octylaluminum chloride, p-tolyethylaluminum chloride, p-tolyl-n-propylaluminum chloride, p-tolylisopropylaluminum chloride, p-tolyl-n-butylaluminum chloride, p-tolylisobutylaluminum chloride, p-tolyl-n-octylaluminum chloride, benzylethylaluminum chloride, benzyl-n-propylaluminum chloride, benzylisopropylaluminum chloride, benzyl-n-butylaluminum chloride, benzylisobutylaluminum chloride, and benzyl-n-octylaluminum chloride.

[0037] Suitable hydrocarbylaluminum dihalide compounds include, but are not limited to, ethylaluminum dichloride, n-propylaluminum dichloride, isopropylaluminum dichloride, n-butylaluminum dichloride, isobutylaluminum dichloride, and n-octylaluminum dichloride.

[0038] Other organoaluminum compounds useful as alkylating agents that may be represented by the general formula $\text{AlR}_n\text{X}_{3-n}$ include, but are not limited to, dimethylaluminum hexanoate, diethylaluminum octoate, diisobutylaluminum 2-ethylhexanoate, dimethylaluminum neodecanoate, diethylaluminum stearate, diisobutylaluminum oleate, methylaluminum bis(hexanoate), ethylaluminum bis(octoate), isobutylaluminum bis(2-ethylhexanoate), methylaluminum bis(neodecanoate), ethylaluminum bis(stearate), isobutylaluminum bis(oleate), dimethylaluminum methoxide, diethylaluminum methoxide, diisobutylaluminum methoxide, dimethylaluminum ethoxide, diethylaluminum ethoxide, diisobutylaluminum ethoxide, dimethylaluminum phenoxide, diethylaluminum phenoxide, diisobutylaluminum phenoxide, methylaluminum dimethoxide, ethylaluminum dimethoxide, isobutylaluminum dimethoxide, methylaluminum diethoxide, ethylaluminum diethoxide, isobutylaluminum diethoxide, methylaluminum diphenoxide, ethylaluminum diphenoxide, and isobutylaluminum diphenoxide.

[0039] Another class of organoaluminum compounds suitable for use as an alkylating agent in the present invention is aluminoxanes. Aluminoxanes can comprise oligomeric linear aluminoxanes, which can be represented by the general formula:

and oligomeric cyclic aluminoxanes, which can be represented by the general formula:

where x can be an integer in the range of from 1 to about 100, or about 10 to about 50; y can be an integer in the range of from 2 to about 100, or about 3 to about 20; and where each R independently can be a monovalent organic group that is attached to the aluminum atom via a carbon atom. In one embodiment, each R independently can be a hydrocarbyl group including, but not limited to, alkyl, cycloalkyl, substituted cycloalkyl, alkenyl, cycloalkenyl, substituted cycloalkenyl, aryl, substituted aryl, aralkyl, alkaryl, allyl, and alkynyl groups, with each group containing in the range of from 1 carbon atom, or the appropriate minimum number of carbon atoms to form the group, up to about 20 carbon atoms. These hydrocarbyl groups may also contain heteroatoms including, but not limited to, nitrogen, oxygen, boron, silicon, sulfur, and phosphorus atoms. It should be noted that the number of moles of the aluminoxane as used in this application refers to the number of moles of the aluminum atoms rather than the number of moles of the oligomeric aluminoxane molecules. This convention is commonly employed in the art of catalyst systems utilizing aluminoxanes.

[0040] Aluminoxanes can be prepared by reacting trihydrocarbylaluminum compounds with water. This reaction can be performed according to known methods, such as, for example, (1) a method in which the trihydrocarbylaluminum compound is dissolved in an organic solvent and then contacted with water, (2) a method in which

the trihydrocarbylaluminum compound is reacted with water of crystallization contained in, for example, metal salts, or water adsorbed in inorganic or organic compounds, or (3) a method in which the trihydrocarbylaluminum compound is reacted with water in the presence of the monomer or monomer solution that is to be polymerized.

[0041] Suitable aluminosilane compounds include, but are not limited to, methylaluminosilane (“MAO”), modified methylaluminosilane (“MMAO”), ethylaluminosilane, n-propylaluminosilane, isopropylaluminosilane, butylaluminosilane, isobutylaluminosilane, n-pentylaluminosilane, neopentylaluminosilane, n-hexylaluminosilane, n-octylaluminosilane, 2-ethylhexylaluminosilane, cyclohexylaluminosilane, 1-methylcyclopentylaluminosilane, phenylaluminosilane, and 2,6-dimethylphenylaluminosilane. Modified methylaluminosilane can be formed by substituting about 20 to 80 percent of the methyl groups of methylaluminosilane with C₂ to C₁₂ hydrocarbyl groups, preferably with isobutyl groups, by using techniques known to those skilled in the art.

[0042] Aluminosilanes can be used alone or in combination with other organoaluminum compounds. In one embodiment, methylaluminosilane and at least one other organoaluminum compound (e.g., AlR_nX_{3-n}), such as diisobutyl aluminum hydride, can be employed in combination. U.S. Publication No. 2008/0182954, which is incorporated herein by reference in its entirety, provides other examples where aluminosilanes and organoaluminum compounds can be employed in combination.

[0043] As mentioned above, alkylating agents useful in the present invention can comprise organomagnesium compounds. In one or more embodiments, organomagnesium compounds that can be utilized include those represented by the general formula MgR₂, where each R independently can be a monovalent organic group that is attached to the magnesium atom via a carbon atom. In one or more embodiments, each R independently can be a hydrocarbyl group including, but not limited to, alkyl, cycloalkyl, substituted cycloalkyl, alkenyl, cycloalkenyl, substituted cycloalkenyl, aryl, allyl, substituted aryl, aralkyl, alkaryl, and alkynyl groups, with each group containing in the range of from 1 carbon atom, or the appropriate

minimum number of carbon atoms to form the group, up to about 20 carbon atoms. These hydrocarbyl groups may also contain heteroatoms including, but not limited to, nitrogen, oxygen, silicon, sulfur, and phosphorus atoms.

[0044] Suitable organomagnesium compounds that may be represented by the general formula MgR_2 include, but are not limited to, diethylmagnesium, di-n-propylmagnesium, diisopropylmagnesium, dibutylmagnesium, dihexylmagnesium, diphenylmagnesium, and dibenzylmagnesium.

[0045] Another class of organomagnesium compounds that can be utilized as an alkylating agent may be represented by the general formula $RMgX$, where R can be a monovalent organic group that is attached to the magnesium atom via a carbon atom, and X can be a hydrogen atom, a halogen atom, a carboxylate group, an alkoxide group, or an aryloxy group. Where the alkylating agent is an organomagnesium compound that includes a halogen atom, the organomagnesium compound can serve as both the alkylating agent and at least a portion of the halogen source in the catalyst systems. In one or more embodiments, R can be a hydrocarbyl group including, but not limited to, alkyl, cycloalkyl, substituted cycloalkyl, alkenyl, cycloalkenyl, substituted cycloalkenyl, aryl, allyl, substituted aryl, aralkyl, alkaryl, and alkynyl groups, with each group containing in the range of from 1 carbon atom, or the appropriate minimum number of carbon atoms to form the group, up to about 20 carbon atoms. These hydrocarbyl groups may also contain heteroatoms including, but not limited to, nitrogen, oxygen, boron, silicon, sulfur, and phosphorus atoms. In one embodiment, X can be a carboxylate group, an alkoxide group, or an aryloxy group, with each group containing in the range of from 1 to about 20 carbon atoms.

[0046] Types of organomagnesium compounds that may be represented by the general formula $RMgX$ include, but are not limited to, hydrocarbylmagnesium hydride, hydrocarbylmagnesium halide, hydrocarbylmagnesium carboxylate, hydrocarbylmagnesium alkoxide, and hydrocarbylmagnesium aryloxy.

[0047] Suitable organomagnesium compounds that may be represented by the general formula $RMgX$ include, but are not limited to, methylmagnesium hydride, ethylmagnesium hydride, butylmagnesium hydride, hexylmagnesium hydride,

phenylmagnesium hydride, benzylmagnesium hydride, methylmagnesium chloride, ethylmagnesium chloride, butylmagnesium chloride, hexylmagnesium chloride, phenylmagnesium chloride, benzylmagnesium chloride, methylmagnesium bromide, ethylmagnesium bromide, butylmagnesium bromide, hexylmagnesium bromide, phenylmagnesium bromide, benzylmagnesium bromide, methylmagnesium hexanoate, ethylmagnesium hexanoate, butylmagnesium hexanoate, hexylmagnesium hexanoate, phenylmagnesium hexanoate, benzylmagnesium hexanoate, methylmagnesium ethoxide, ethylmagnesium ethoxide, butylmagnesium ethoxide, hexylmagnesium ethoxide, phenylmagnesium ethoxide, benzylmagnesium ethoxide, methylmagnesium phenoxide, ethylmagnesium phenoxide, butylmagnesium phenoxide, hexylmagnesium phenoxide, phenylmagnesium phenoxide, and benzylmagnesium phenoxide.

[0048] As mentioned above, the lanthanide-based catalyst systems employed in the present invention can include a halogen source. As used herein, the term halogen source refers to any substance including at least one halogen atom. In one or more embodiments, at least a portion of the halogen source can be provided by either of the above-described lanthanide-containing compound and/or the above-described alkylating agent, when those compounds contain at least one halogen atom. In other words, the lanthanide-containing compound can serve as both the lanthanide-containing compound and at least a portion of the halogen source. Similarly, the alkylating agent can serve as both the alkylating agent and at least a portion of the halogen source.

[0049] In another embodiment, at least a portion of the halogen source can be present in the catalyst systems in the form of a separate and distinct halogen-containing compound. Various compounds, or mixtures thereof, that contain one or more halogen atoms can be employed as the halogen source. Examples of halogen atoms include, but are not limited to, fluorine, chlorine, bromine, and iodine. A combination of two or more halogen atoms can also be utilized. Halogen-containing compounds that are soluble in a hydrocarbon solvent are suitable for use in the present invention. Hydrocarbon-insoluble halogen-containing compounds, however,

can be suspended in a polymerization system to form the catalytically active species, and are therefore also useful.

[0050] Useful types of halogen-containing compounds that can be employed include, but are not limited to, elemental halogens, mixed halogens, hydrogen halides, organic halides, inorganic halides, metallic halides, and organometallic halides.

[0051] Elemental halogens suitable for use in the present invention include, but are not limited to, fluorine, chlorine, bromine, and iodine. Some specific examples of suitable mixed halogens include iodine monochloride, iodine monobromide, iodine trichloride, and iodine pentafluoride.

[0052] Hydrogen halides include, but are not limited to, hydrogen fluoride, hydrogen chloride, hydrogen bromide, and hydrogen iodide.

[0053] Organic halides include, but are not limited to, t-butyl chloride, t-butyl bromide, allyl chloride, allyl bromide, benzyl chloride, benzyl bromide, chloro-di-phenylmethane, bromo-di-phenylmethane, triphenylmethyl chloride, triphenylmethyl bromide, benzylidene chloride, benzylidene bromide, methyltrichlorosilane, phenyltrichlorosilane, dimethyldichlorosilane, diphenyldichlorosilane, trimethylchlorosilane, benzoyl chloride, benzoyl bromide, propionyl chloride, propionyl bromide, methyl chloroformate, and methyl bromoformate.

[0054] Inorganic halides include, but are not limited to, phosphorus trichloride, phosphorus tribromide, phosphorus pentachloride, phosphorus oxychloride, phosphorus oxybromide, boron trifluoride, boron trichloride, boron tribromide, silicon tetrafluoride, silicon tetrachloride, silicon tetrabromide, silicon tetraiodide, arsenic trichloride, arsenic tribromide, arsenic triiodide, selenium tetrachloride, selenium tetrabromide, tellurium tetrachloride, tellurium tetrabromide, and tellurium tetraiodide.

[0055] Metallic halides include, but are not limited to, tin tetrachloride, tin tetrabromide, aluminum trichloride, aluminum tribromide, antimony trichloride, antimony pentachloride, antimony tribromide, aluminum triiodide, aluminum trifluoride, gallium trichloride, gallium tribromide, gallium triiodide, gallium trifluoride, indium trichloride, indium tribromide, indium triiodide, indium trifluoride,

titanium tetrachloride, titanium tetrabromide, titanium tetraiodide, zinc dichloride, zinc dibromide, zinc diiodide, and zinc difluoride.

[0056] Organometallic halides include, but are not limited to, dimethylaluminum chloride, diethylaluminum chloride, dimethylaluminum bromide, diethylaluminum bromide, dimethylaluminum fluoride, diethylaluminum fluoride, methylaluminum dichloride, ethylaluminum dichloride, methylaluminum dibromide, ethylaluminum dibromide, methylaluminum difluoride, ethylaluminum difluoride, methylaluminum sesquichloride, ethylaluminum sesquichloride, isobutylaluminum sesquichloride, methylmagnesium chloride, methylmagnesium bromide, methylmagnesium iodide, ethylmagnesium chloride, ethylmagnesium bromide, butylmagnesium chloride, butylmagnesium bromide, phenylmagnesium chloride, phenylmagnesium bromide, benzylmagnesium chloride, trimethyltin chloride, trimethyltin bromide, triethyltin chloride, triethyltin bromide, di-t-butyltin dichloride, di-t-butyltin dibromide, dibutyltin dichloride, dibutyltin dibromide, tributyltin chloride, and tributyltin bromide.

[0057] In one or more embodiments, the above-described catalyst systems can comprise a compound containing a non-coordinating anion or a non-coordinating anion precursor. In one or more embodiments, a compound containing a non-coordinating anion, or a non-coordinating anion precursor can be employed in lieu of the above-described halogen source. A non-coordinating anion is a sterically bulky anion that does not form coordinate bonds with, for example, the active center of a catalyst system due to steric hindrance. Non-coordinating anions useful in the present invention include, but are not limited to, tetraarylborate anions and fluorinated tetraarylborate anions. Compounds containing a non-coordinating anion can also contain a counter cation, such as a carbonium, ammonium, or phosphonium cation. Exemplary counter cations include, but are not limited to, triarylcarbonium cations and N,N-dialkylanilinium cations. Examples of compounds containing a non-coordinating anion and a counter cation include, but are not limited to, triphenylcarbonium tetrakis(pentafluorophenyl)borate, N,N-dimethylanilinium tetrakis(pentafluorophenyl)borate, triphenylcarbonium tetrakis[3,5-

bis(trifluoromethyl)phenyl]borate, and N,N-dimethylanilinium tetrakis[3,5-bis(trifluoromethyl)phenyl]borate.

[0058] A non-coordinating anion precursor can also be used in this embodiment. A non-coordinating anion precursor is a compound that is able to form a non-coordinating anion under reaction conditions. Useful non-coordinating anion precursors include, but are not limited to, triarylboron compounds, BR_3 , where R is a strong electron-withdrawing aryl group, such as a pentafluorophenyl or 3,5-bis(trifluoromethyl)phenyl group.

[0059] The lanthanide-based catalyst composition used in this invention may be formed by combining or mixing the foregoing catalyst ingredients. Although one or more active catalyst species are believed to result from the combination of the lanthanide-based catalyst ingredients, the degree of interaction or reaction between the various catalyst ingredients or components is not known with any great degree of certainty. Therefore, the term “catalyst composition” has been employed to encompass a simple mixture of the ingredients, a complex of the various ingredients that is caused by physical or chemical forces of attraction, a chemical reaction product of the ingredients, or a combination of the foregoing.

[0060] The foregoing lanthanide-based catalyst composition may have high catalytic activity for polymerizing conjugated dienes into cis-1,4-polydienes over a wide range of catalyst concentrations and catalyst ingredient ratios. Several factors may impact the optimum concentration of any one of the catalyst ingredients. For example, because the catalyst ingredients may interact to form an active species, the optimum concentration for any one catalyst ingredient may be dependent upon the concentrations of the other catalyst ingredients.

[0061] In one or more embodiments, the molar ratio of the alkylating agent to the lanthanide-containing compound (alkylating agent/Ln) can be varied from about 1:1 to about 1,000:1, in other embodiments from about 2:1 to about 500:1, and in other embodiments from about 5:1 to about 200:1.

[0062] In those embodiments where both an aluminoxane and at least one other organoaluminum agent are employed as alkylating agents, the molar ratio of the

aluminoxane to the lanthanide-containing compound (aluminoxane/Ln) can be varied from 5:1 to about 1,000:1, in other embodiments from about 10:1 to about 700:1, and in other embodiments from about 20:1 to about 500:1; and the molar ratio of the at least one other organoaluminum compound to the lanthanide-containing compound (Al/Ln) can be varied from about 1:1 to about 200:1, in other embodiments from about 2:1 to about 150:1, and in other embodiments from about 5:1 to about 100:1.

[0063] The molar ratio of the halogen-containing compound to the lanthanide-containing compound is best described in terms of the ratio of the moles of halogen atoms in the halogen source to the moles of lanthanide atoms in the lanthanide-containing compound (halogen/Ln). In one or more embodiments, the halogen/Ln molar ratio can be varied from about 0.5:1 to about 20:1, in other embodiments from about 1:1 to about 10:1, and in other embodiments from about 2:1 to about 6:1.

[0064] In yet another embodiment, the molar ratio of the non-coordinating anion or non-coordinating anion precursor to the lanthanide-containing compound (An/Ln) may be from about 0.5:1 to about 20:1, in other embodiments from about 0.75:1 to about 10:1, and in other embodiments from about 1:1 to about 6:1.

[0065] The lanthanide-based catalyst composition can be formed by various methods.

[0066] In one embodiment, the lanthanide-based catalyst composition may be formed *in situ* by adding the catalyst ingredients to a solution containing monomer and solvent, or to bulk monomer, in either a stepwise or simultaneous manner. In one embodiment, the alkylating agent can be added first, followed by the lanthanide-containing compound, and then followed by the halogen source or by the compound containing a non-coordinating anion or the non-coordinating anion precursor.

[0067] In another embodiment, the lanthanide-based catalyst composition may be preformed. That is, the catalyst ingredients are pre-mixed outside the polymerization system either in the absence of any monomer or in the presence of a small amount of at least one conjugated diene monomer at an appropriate temperature, which may be from about -20 °C to about 80 °C. The amount of conjugated diene monomer that

may be used for preforming the catalyst can range from about 1 to about 500 moles, in other embodiments from about 5 to about 250 moles, and in other embodiments from about 10 to about 100 moles per mole of the lanthanide-containing compound. The resulting catalyst composition may be aged, if desired, prior to being added to the monomer that is to be polymerized.

[0068] In yet another embodiment, the lanthanide-based catalyst composition may be formed by using a two-stage procedure. The first stage may involve combining the alkylating agent with the lanthanide-containing compound either in the absence of any monomer or in the presence of a small amount of at least one conjugated diene monomer at an appropriate temperature, which may be from about -20 °C to about 80 °C. The amount of monomer employed in the first stage may be similar to that set forth above for preforming the catalyst. In the second stage, the mixture formed in the first stage and the halogen source, non-coordinating anion, or non-coordinating anion precursor can be charged in either a stepwise or simultaneous manner to the monomer that is to be polymerized.

ANIONIC POLYMERIZATION

[0069] In one or more embodiments, the reactive polymer is prepared by anionic polymerization, wherein monomer is polymerized by using an anionic initiator. The key mechanistic features of anionic polymerization have been described in books (e.g., Hsieh, H. L.; Quirk, R. P. *Anionic Polymerization: Principles and Practical Applications*; Marcel Dekker: New York, 1996) and review articles (e.g., Hadjichristidis, N.; Pitsikalis, M.; Pispas, S.; Iatrou, H.; *Chem. Rev.* 2001, 101(12), 3747-3792). Anionic initiators may advantageously produce living polymers that, prior to quenching, are capable of reacting with additional monomers for further chain growth or reacting with certain coupling agents to give coupled polymers.

[0070] The practice of this invention is not limited by the selection of any particular anionic initiators. In one or more embodiments, the anionic initiator employed is a functional initiator that imparts a functional group at the head of the polymer chain (i.e., the location from which the polymer chain is started). In particular embodiments, the functional group includes one or more heteroatoms (e.g.,

nitrogen, oxygen, boron, silicon, sulfur, tin, and phosphorus atoms) or heterocyclic groups. In certain embodiments, the functional group reduces the 50 °C hysteresis loss of carbon-black filled vulcanizates prepared from polymers containing the functional group as compared to similar carbon-black filled vulcanizates prepared from polymer that does not include the functional group.

[0071] Exemplary anionic initiators include organolithium compounds. In one or more embodiments, organolithium compounds may include heteroatoms. In these or other embodiments, organolithium compounds may include one or more heterocyclic groups.

[0072] Types of organolithium compounds include alkylolithium, aryllithium compounds, and cycloalkyllithium compounds. Specific examples of organolithium compounds include ethyllithium, n-propyllithium, isopropyllithium, n-butyllithium, sec-butyllithium, t-butyllithium, n-amyllithium, isoamyllithium, and phenyllithium.

[0073] Other anionic initiators include alkylmagnesium halide compounds such as butylmagnesium bromide and phenylmagnesium bromide. Still other anionic initiators include organosodium compounds such as phenylsodium and 2,4,6-trimethylphenylsodium. Also contemplated are those anionic initiators that give rise to di-living polymers, wherein both ends of a polymer chain are living. Examples of such initiators include dilithio initiators such as those prepared by reacting 1,3-diisopropenylbenzene with sec-butyllithium. These and related difunctional initiators are disclosed in U.S. Pat. No. 3,652,516, which is incorporated herein by reference. Radical anionic initiators may also be employed, including those described in U.S. Pat. No. 5,552,483, which is incorporated herein by reference.

[0074] In particular embodiments, the organolithium compounds include a cyclic amine-containing compound such as lithiohexamethyleneimine. These and related useful initiators are disclosed in the U.S. Pat. Nos. 5,332,810, 5,329,005, 5,578,542, 5,393,721, 5,698,646, 5,491,230, 5,521,309, 5,496,940, 5,574,109, and 5,786,441, which are incorporated herein by reference. In other embodiments, the organolithium compounds include lithiated alkylthioacetals such as 2-lithio-2-methyl-1,3-dithiane. These and related useful initiators are disclosed in U.S. Publ. Nos. 2006/0030657,

2006/0264590, and 2006/0264589, which are incorporated herein by reference. In still other embodiments, the organolithium compounds include alkoxysilyl-containing initiators, such as lithiated t-butyldimethylpropoxysilane. These and related useful initiators are disclosed in U.S. Publ. No. 2006/0241241, which is incorporated herein by reference.

[0075] In one or more embodiments, the anionic initiator employed is trialkyltinlithium compound such as tri-n-butylinlithium. These and related useful initiators are disclosed in U.S. Pat. Nos. 3,426,006 and 5,268,439, which are incorporated herein by reference.

[0076] When elastomeric copolymers containing conjugated diene monomers and vinyl-substituted aromatic monomers are prepared by anionic polymerization, the conjugated diene monomers and vinyl-substituted aromatic monomers may be used at a weight ratio of 95:5 to 50:50, or in other embodiments, 90:10 to 65:35. In order to promote the randomization of comonomers in copolymerization and to control the microstructure (such as 1,2-linkage of conjugated diene monomer) of the polymer, a randomizer, which is typically a polar coordinator, may be employed along with the anionic initiator.

[0077] Compounds useful as randomizers include those having an oxygen or nitrogen heteroatom and a non-bonded pair of electrons. Exemplary types of randomizers include linear and cyclic oligomeric oxolanyl alkanes; dialkyl ethers of mono and oligo alkylene glycols (also known as glyme ethers); crown ethers; tertiary amines; linear THF oligomers; alkali metal alkoxides; and alkali metal sulfonates. Linear and cyclic oligomeric oxolanyl alkanes are described in U.S. Pat. No. 4,429,091, which is incorporated herein by reference. Specific examples of randomizers include 2,2-bis(2'-tetrahydrofuryl)propane, 1,2-dimethoxyethane, N,N,N',N'-tetramethylethylenediamine (TMEDA), tetrahydrofuran (THF), 1,2-dipiperidylethane, dipiperidylmethane, hexamethylphosphoramide, N,N'-dimethylpiperazine, diazabicyclooctane, dimethyl ether, diethyl ether, tri-n-butylamine, potassium t-amylate, potassium 4-dodecylsulfonate, and mixtures thereof.

[0078] The amount of randomizer to be employed may depend on various factors such as the desired microstructure of the polymer, the ratio of monomer to comonomer, the polymerization temperature, as well as the nature of the specific randomizer employed. In one or more embodiments, the amount of randomizer employed may range between 0.05 and 100 moles per mole of the anionic initiator.

[0079] The anionic initiator and the randomizer can be introduced to the polymerization system by various methods. In one or more embodiments, the anionic initiator and the randomizer may be added separately to the monomer to be polymerized in either a stepwise or simultaneous manner. In other embodiments, the anionic initiator and the randomizer may be pre-mixed outside the polymerization system either in the absence of any monomer or in the presence of a small amount of monomer, and the resulting mixture may be aged, if desired, and then added to the monomer that is to be polymerized.

[0080] In one or more embodiments, regardless of whether a coordination catalyst or an anionic initiator is used to prepare the reactive polymer, a solvent may be employed as a carrier to either dissolve or suspend the catalyst or initiator in order to facilitate the delivery of the catalyst or initiator to the polymerization system. In other embodiments, monomer can be used as the carrier. In yet other embodiments, the catalyst or initiator can be used in their neat state without any solvent.

[0081] In one or more embodiments, suitable solvents include those organic compounds that will not undergo polymerization or incorporation into propagating polymer chains during the polymerization of monomer in the presence of the catalyst or initiator. In one or more embodiments, these organic species are liquid at ambient temperature and pressure. In one or more embodiments, these organic solvents are inert to the catalyst or initiator. Exemplary organic solvents include hydrocarbons with a low or relatively low boiling point such as aromatic hydrocarbons, aliphatic hydrocarbons, and cycloaliphatic hydrocarbons. Non-limiting examples of aromatic hydrocarbons include benzene, toluene, xylenes, ethylbenzene, diethylbenzene, and mesitylene. Non-limiting examples of aliphatic hydrocarbons include n-pentane, n-hexane, n-heptane, n-octane, n-nonane, n-decane, isopentane, isohexanes,

isopentanes, isooctanes, 2,2-dimethylbutane, petroleum ether, kerosene, and petroleum spirits. And, non-limiting examples of cycloaliphatic hydrocarbons include cyclopentane, cyclohexane, methylcyclopentane, and methylcyclohexane. Mixtures of the above hydrocarbons may also be used. As is known in the art, aliphatic and cycloaliphatic hydrocarbons may be desirably employed for environmental reasons. The low-boiling hydrocarbon solvents are typically separated from the polymer upon completion of the polymerization.

[0082] Other examples of organic solvents include high-boiling hydrocarbons of high molecular weights, including hydrocarbon oils that are commonly used to oil-extend polymers. Examples of these oils include paraffinic oils, aromatic oils, naphthenic oils, vegetable oils other than castor oils, and low PCA oils including MES, TDAE, SRAE, heavy naphthenic oils. Since these hydrocarbons are non-volatile, they typically do not require separation and remain incorporated in the polymer.

[0083] The production of the reactive polymer according to this invention can be accomplished by polymerizing conjugated diene monomer, optionally together with monomer copolymerizable with conjugated diene monomer, in the presence of a catalytically effective amount of the catalyst or initiator. The introduction of the catalyst or initiator, the conjugated diene monomer, optionally the comonomer, and any solvent, if employed, forms a polymerization mixture in which the reactive polymer is formed. The amount of the catalyst or initiator to be employed may depend on the interplay of various factors such as the type of catalyst or initiator employed, the purity of the ingredients, the polymerization temperature, the polymerization rate and conversion desired, the molecular weight desired, and many other factors. Accordingly, a specific catalyst or initiator amount cannot be definitively set forth except to say that catalytically effective amounts of the catalyst or initiator may be used.

[0084] In one or more embodiments, the amount of the coordinating metal compound (e.g., a lanthanide-containing compound) used can be varied from about 0.001 to about 2 mmol, in other embodiments from about 0.005 to about 1 mmol,

and in still other embodiments from about 0.01 to about 0.2 mmol per 100 gram of monomer.

[0085] In other embodiments, where an anionic initiator (e.g., an alkyllithium compound) is employed, the initiator loading may be varied from about 0.05 to about 100 mmol, in other embodiments from about 0.1 to about 50 mmol, and in still other embodiments from about 0.2 to about 5 mmol per 100 gram of monomer.

[0086] In one or more embodiments, the polymerization may be carried out in a polymerization system that includes a substantial amount of solvent. In one embodiment, a solution polymerization system may be employed in which both the monomer to be polymerized and the polymer formed are soluble in the solvent. In another embodiment, a precipitation polymerization system may be employed by choosing a solvent in which the polymer formed is insoluble. In both cases, an amount of solvent in addition to the amount of solvent that may be used in preparing the catalyst or initiator is usually added to the polymerization system. The additional solvent may be the same as or different from the solvent used in preparing the catalyst or initiator. Exemplary solvents have been set forth above. In one or more embodiments, the solvent content of the polymerization mixture may be more than 20% by weight, in other embodiments more than 50% by weight, and in still other embodiments more than 80% by weight based on the total weight of the polymerization mixture.

[0087] In other embodiments, the polymerization system employed may be generally considered a bulk polymerization system that includes substantially no solvent or a minimal amount of solvent. Those skilled in the art will appreciate the benefits of bulk polymerization processes (i.e., processes where monomer acts as the solvent), and therefore the polymerization system includes less solvent than will deleteriously impact the benefits sought by conducting bulk polymerization. In one or more embodiments, the solvent content of the polymerization mixture may be less than about 20% by weight, in other embodiments less than about 10% by weight, and in still other embodiments less than about 5% by weight based on the total weight of the polymerization mixture. In another embodiment, the polymerization mixture

contains no solvents other than those that are inherent to the raw materials employed. In still another embodiment, the polymerization mixture is substantially devoid of solvent, which refers to the absence of that amount of solvent that would otherwise have an appreciable impact on the polymerization process. Polymerization systems that are substantially devoid of solvent may be referred to as including substantially no solvent. In particular embodiments, the polymerization mixture is devoid of solvent.

[0088] The polymerization may be conducted in any conventional polymerization vessels known in the art. In one or more embodiments, solution polymerization can be conducted in a conventional stirred-tank reactor. In other embodiments, bulk polymerization can be conducted in a conventional stirred-tank reactor, especially if the monomer conversion is less than about 60%. In still other embodiments, especially where the monomer conversion in a bulk polymerization process is higher than about 60%, which typically results in a highly viscous cement, the bulk polymerization may be conducted in an elongated reactor in which the viscous cement under polymerization is driven to move by piston, or substantially by piston. For example, extruders in which the cement is pushed along by a self-cleaning single-screw or double-screw agitator are suitable for this purpose. Examples of useful bulk polymerization processes are disclosed in U.S. Patent No. 7,351,776, which is incorporated herein by reference.

[0089] In one or more embodiments, all of the ingredients used for the polymerization can be combined within a single vessel (e.g., a conventional stirred-tank reactor), and all steps of the polymerization process can be conducted within this vessel. In other embodiments, two or more of the ingredients can be pre-combined in one vessel and then transferred to another vessel where the polymerization of monomer (or at least a major portion thereof) may be conducted.

[0090] The polymerization can be carried out as a batch process, a continuous process, or a semi-continuous process. In the semi-continuous process, the monomer is intermittently charged as needed to replace that monomer already polymerized. In one or more embodiments, the conditions under which the polymerization proceeds

may be controlled to maintain the temperature of the polymerization mixture within a range from about -10 °C to about 200 °C, in other embodiments from about 0 °C to about 150 °C, and in other embodiments from about 20 °C to about 100 °C. In one or more embodiments, the heat of polymerization may be removed by external cooling by a thermally controlled reactor jacket, internal cooling by evaporation and condensation of the monomer through the use of a reflux condenser connected to the reactor, or a combination of the two methods. Also, the polymerization conditions may be controlled to conduct the polymerization under a pressure of from about 0.1 atmosphere to about 50 atmospheres, in other embodiments from about 0.5 atmosphere to about 20 atmosphere, and in other embodiments from about 1 atmosphere to about 10 atmospheres. In one or more embodiments, the pressures at which the polymerization may be carried out include those that ensure that the majority of the monomer is in the liquid phase. In these or other embodiments, the polymerization mixture may be maintained under anaerobic conditions.

COUPLING WITH POLYISOCYANATE AND POLYOL

[0091] Regardless of whether the polymerization is catalyzed or initiated by a coordination catalyst (*e.g.*, a lanthanide-based catalyst) or an anionic initiator (*e.g.*, an alkyllithium initiator), some or all of the resulting polymer chains may possess reactive chain ends before the polymerization mixture is quenched. As noted above, the reactive polymer prepared with a coordination catalyst (*e.g.*, a lanthanide-based catalyst) may be referred to as a pseudo-living polymer, and the reactive polymer prepared with an anionic initiator (*e.g.*, an alkyllithium initiator) may be referred to as a living polymer. In one or more embodiments, a polymerization mixture including reactive polymer may be referred to as an active polymerization mixture. The percentage of polymer chains possessing a reactive end depends on various factors such as the type of catalyst or initiator, the type of monomer, the purity of the ingredients, the polymerization temperature, the monomer conversion, and many other factors. In one or more embodiments, at least about 20% of the polymer chains possess a reactive end, in other embodiments at least about 50% of the polymer chains possess a reactive end, and in still other embodiments at least about 80% of the

polymer chains possess a reactive end. In any event, the reactive polymer can be reacted with a polyisocyanate to form an intermediate polymer product that can then be reacted with a polyol to form the coupled polymer of this invention.

[0092] In one or more embodiments, the total functionality of the polyisocyanate and the polyol used in preparing the coupled polymers of this invention is at least 5. The functionality of the polyisocyanate, which refers to the number of isocyanate groups within the polyisocyanate molecule, may be represented by the variable X and is greater than or equal to 2. The functionality of the polyol, which refers to the number of isocyanate groups within the polyisocyanate molecule, may be represented by the variable Y and is greater than or equal to 2. Thus, stated another way, $X + Y \geq 5$ with $X \geq 2$ and $Y \geq 2$.

[0093] In one or more embodiments, the polyisocyanates employed in practice of the present invention include at least two isocyanato functional groups, which isocyanato functional groups may be defined by the formula —N=C=O . Accordingly, the polyisocyanates may be defined by the formula R(NCO)_x , where x is an integer from 2 to 20, in other embodiments from 2 to 10, and in other embodiments from 2 to 3, and where R is a multivalent organic group. In particular embodiments, x is 3.

[0094] Examples of multivalent organic groups include divalent organic groups. In one or more embodiments, the divalent organic groups include hydrocarbylene groups or substituted hydrocarbylene groups such as, but not limited to, alkylene, cycloalkylene, alkenylene, cycloalkenylene, alkynylene, cycloalkynylene, or arylene groups. Substituted hydrocarbylene groups include hydrocarbylene groups in which one or more hydrogen atoms have been replaced by a substituent such as an alkyl group. In one or more embodiments, these groups may include from one, or the appropriate minimum number of carbon atoms to form the group, to about 20 carbon atoms. These groups may also contain one or more heteroatoms such as, but not limited to, nitrogen, oxygen, boron, silicon, sulfur, tin, and phosphorus atoms.

[0095] In these or other embodiments, the multivalent organic group includes a polymeric species or oligomeric species.

[0096] In one or more embodiments, the polyisocyanates may be defined as polyisocyanato hydrocarbyls, which may include, but are not limited to, diisocyanato hydrocarbyls and triisocyanato hydrocarbyls. In one or more embodiments, diisocyanato hydrocarbyls include. In one or more embodiments, triisocyanato hydrocarbyls include triisocyanatoalkyls, triisocyanatocycloalkyls, triisocyanatoaryls, triisocyanatoalkenyls, and triisocyanatoalkynyls.

[0097] Exemplary diisocyanato alkyls include 1,8-diisocyanatooctane, 1,6-diisocyanatohexane [also called hexamethylene diisocyanate], 1,5-diisocyanatohexane, 1,4-diisocyanatohexane, 1,3-diisocyanatohexane, 1,2-diisocyanatohexane, 1,5-diisocyanatopentane, 1,4-diisocyanatopentane, 1,3-diisocyanatopentane, 1,2-diisocyanatopentane, 1,4-diisocyanatobutane, 1,3-diisocyanatobutane, 1,2-diisocyanatobutane, 1,3-diisocyanatopropane, 1,2-diisocyanopropane, and 1,3-bis(1-isocyanato-1-methylethyl)benzene.

[0098] Exemplary diisocyanato cycloalkyls include 5-isocyanato-1-(isocyanatomethyl)-1,3,3-trimethyl-cyclohexane [also called isophorone diisocyanate], 1,8-diisocyanatocyclooctane, 1,6-diisocyanatocyclohexane, 1,5-diisocyanatocyclohexane, 1,4-diisocyanatocyclohexane, 1,3-diisocyanatocyclohexane, 1,2-diisocyanatocyclohexane, 1,5-diisocyanatocyclopentane, 1,4-diisocyanatocyclopentane, 1,3-diisocyanatocyclopentane, 1,2-diisocyanatocyclopentane, and 4,4'-methylenebis(cyclohexyl isocyanate).

[0099] Exemplary diisocyanato aryls include 1-isocyanato-2-[(2-isocyanatophenyl)methyl]-benzene [also called 2,4-methylene diphenyl diisocyanate], 1-isocyanato-2-[(4-isocyanatophenyl)methyl]-benzene [also called 2,4-methylene diphenyl diisocyanate], 1-isocyanato-4-[(4-isocyanatophenyl)methyl]-benzene [also called 4,4'-methylene diphenyl diisocyanate], 2,4-diisocyanato-1-methyl-benzene [also called tolylene-2,4-diisocyanate], 2,5-diisocyanato-1-methyl-benzene [also called tolylene-2,5-diisocyanate], 2,6-diisocyanato-1-methyl-benzene [also called tolylene-2,6-diisocyanate], 1,4-diisocyanatobenzene [also called 1,4-phenylene diisocyanate], 1,3-diisocyanatobenzene [also called 1,3-phenylene diisocyanate], 1,2-diisocyanatobenzene [also called 1,3-phenylene diisocyanate], 1,5-

diisocyanatonaphthalene, 1,6-diisocyanatonaphthalene [also called 1,5-naphthalene diisocyanate], m-xylylene diisocyanate, poly(propylene glycol), tolylene 2,4-diisocyanate terminated, poly(ethylene adipate), tolylene 2,4-diisocyanate terminated, 2,4,6-trimethyl-1,3-phenylene diisocyanate, 4-chloro-6-methyl-1,3-phenylene diisocyanate, 4-bromo-6-methyl-1,3-phenylene diisocyanate, 3,3'-dimethyl-4,4'-biphenylene diisocyanate, and 4,4'-methylenebis(phenyl isocyanate).

[00100] Exemplary triisocyanato alkyls include 1,4,8-triisocyanatooctane, 1,3,8-triisocyanatooctane, 2,4,8-triisocyanatooctane, 1,3,5-triisocyanatooctane, 1,3,6-triisocyanatohexane, 1,2,6-triisocyanatohexane, 1,2,5-triisocyanatohexane, 1,3,5-triisocyanatohexane, 1,2,3-triisocyanatohexane, 1,2,5-triisocyanatopentane, and 1,2,4-triisocyanatopentane.

[00101] Exemplary triisocyanato cycloalkyls include 1,4,8-triisocyanatocyclooctane, 1,3,8-triisocyanatocyclooctane, 2,4,8-triisocyanatocyclooctane, 1,3,5-triisocyanatocyclooctane, 1,3,6-triisocyanatocyclohexane, 1,2,6-triisocyanatocyclohexane, 1,2,5-triisocyanatocyclohexane, 1,3,5-triisocyanatocyclohexane, 1,2,3-triisocyanatocyclohexane, 1,2,5-triisocyanatocyclopentane, and 1,2,4-triisocyanatocyclopentane.

[00102] An exemplary triisocyanato aryl includes tris(4-isocyanatophenyl)methane [also called triphenylmethane-4,4',4''-triisocyanate].

[00103] In one or more embodiments, mixtures of two or more of the foregoing polyisocyanates may be employed. In these or other embodiments, oligomers of one or more of the foregoing polyisocyanates may be employed. For example, mixtures of diphenyl methane diisocyanates (MDI) and oligomers thereof are known in the art as "crude" or polymeric MDI having an isocyanate functionality of greater than 2.0.

[00104] In one or more embodiments, the polyols employed in practice of the present invention include at least two hydroxyl functional groups. The polyols may be defined by the formula $R(OH)_x$, where x is an integer from 2 to 20, in other embodiments from 2 to 10, and in other embodiments from 2 to 3, and where R is a multivalent organic group.

[00105] In one or more embodiments, polyols include diols, triols, and polyols with four or more hydroxyl groups. Included among these polyols are polyether polyols and polyester polyols. Useful polyester polyols include phthalic anhydride based polyols and terephthalic based polyols, as well as blends thereof. Useful polyether polyols include those based on sucrose and glycerin.

[00106] In one or more embodiments, the polyols include diols, which may also be referred to as hydrocarbyl diols. In one or more embodiments, hydrocarbyl diols include alkyldiols, cycloalkyldiols, aryldiols, alkenyldiols, and alkynyldiols. In other embodiments, triols include alkyltriols, cycloalkyltriols, aryltriols, alkenyltriols, and alkynyltriols.

[00107] Exemplary alkyldiols include 1,2-ethanediol, 1,3-propanediol, 1,2-propanediol, 1,2-butanediol, 1,3-butanediol, 1,4-butanediol, 1,2-pentanediol, 1,3-pentanediol, 1,4-pentanediol, 1,2-pentanediol, 1,3-pentanediol, 1,4-pentanediol, 1,5-pentanediol, 1,2-hexanediol, 1,3-hexanediol, 1,4-hexanediol, 1,5-hexanediol, 1,6-hexanediol, 1,7-heptanediol, 1,8-octanediol, 1,9-nonanediol, and 1,10-dodecanediol.

[00108] Exemplary aryldiols include 1,2-benzenediol (also called catechol), 1,3-benzenediol (also called resorcinol), and 1,4-benzenediol (also called hydroquinone).

[00109] Exemplary cycloalkyldiols include 1,2-cyclohexanediol, 1,3-cyclohexanediol, 1,4-cyclohexanediol, 1,2-cyclopentanediol, 1,3-cyclopentanediol, 1,4-cyclopentanediol, 1,2-cyclooctanediol, 1,3-cyclooctanediol, 1,4-cyclooctanediol, 1,5-cyclooctanediol, 1,3-cyclododecanediol, and 1,4-cyclododecanediol.

[00110] Exemplary alkenyldiols include 2-butene-1,4-diol, 1-pentene-3,4-diol, 1-pentene-3,5-diol, 1-pentene-4,5-diol, 2-pentene-1,4-diol, 2-pentene-1,5-diol, 1-hexene-3,4-diol, 1-hexene-3,5-diol, 1-hexene-3,6-diol, 1-hexene-4,5-diol, 1-hexene-4,6-diol, 1-hexene-5,6-diol, 2-hexene-1,4-diol, 2-hexene-1,5-diol, 2-hexene-1,6-diol, 3-hexene-1,2-diol, 3-hexene-1,5-diol, 3-hexene-1,6-diol, 3-hexene-2,5-diol, 3-hexene-2,6-diol, 3-heptene-1,7-diol, 4-octene-1,8-diol, 2-nonene-1,9-diol, and 4-dodecene-1,10-diol.

[00111] Exemplary alkyltriols include 1,2,3-propanetriol (also called glycerin or glycerol), 1,2,3-butanetriol, 1,2,4-butanetriol, 1,2,3-pentanetriol, 1,2,4-pentanetriol, 1,2,5-pentanetriol, 1,3,5-pentanetriol, 2,3,4-pentanetriol, 2,3,5-pentanetriol, 1,2,3-hexanetriol, 1,2,4-hexanetriol, 1,2,5-hexanetriol, 1,2,6-hexanetriol, 2,3,4-hexanetriol, 1,3,7-heptanetriol, 1,4,8-octanetriol, 1,3,9-nonanetriol, and 1,5,10-dodecanetriol.

[00112] Exemplary aryltriols include 1,2,3-benzenetriol, 1,3,5-benzenetriol, and 1,2,4-benzenetriol.

[00113] Exemplary cycloalkyltriols include 1,2,3-cyclohexanetriol, 1,3,5-cyclohexanetriol, 1,2,4-cyclohexanetriol, 1,2,3-cyclopentanetriol, 1,2,4-cyclopentanetriol, 1,2,3-cyclooctanetriol, 1,2,4-cyclooctanetriol, 1,2,5-cyclooctanetriol, 1,2,3-cyclododecanetriol, and 1,2,5-cyclododecanetriol.

[00114] Exemplary alkenyltriols include 1-pentene-3,4,5-triol, 2-pentene-1,4,5-triol, 1-hexene-3,4,5-triol, 1-hexene-3,4,6-triol, 1-hexene-3,5,6-triol, 1-hexene-4,5,6-triol, 2-hexene-1,4,5-triol, 2-hexene-1,5,6-triol, 2-hexene-4,5,6-triol, 3-heptenetriol-1,2,7, 4-octenetriol-1,2,8, 1-nonenetriol-4,5,9, and 4-dodecenetriol-1,3,10.

AMOUNTS OF POLYISOCYANATE AND POLYOL

[00115] The amount of the polyisocyanate that can be added to the polymerization mixture to yield the intermediate polymer product may depend on various factors including the type and amount of catalyst or initiator used to synthesize the reactive polymer and the desired degree of coupling.

[00116] In one or more embodiments, where the reactive polymer is prepared by employing a lanthanide-based catalyst, the amount of the polyisocyanate employed to prepare the intermediate polymer product can be described with reference to the moles of isocyanate functionality of the polyisocyanate (*i.e.*, -NCO groups, which may also be referred to as equivalents of isocyanate functionality) and the moles of lanthanide metal associated with the lanthanide-containing compound (*i.e.* Ln). For example, the molar ratio of the isocyanate functionality to the moles of lanthanide metal (-NCO/Ln) may be from about 1000:1 to about 500:1, in other embodiments from about 500:1 to about 100:1, and in other embodiments from about 100:1 to about 1:1.

[00117] In other embodiments, such as where the reactive polymer is prepared by using an anionic initiator, the amount of the polyisocyanate employed to prepare the intermediate polymer product can be described with reference to the moles of isocyanate functionality of the polyisocyanate (*i.e.*, -NCO groups) and the moles of metal cation (*e.g.* Li) associated with the initiator. For example, where an organolithium initiator is employed, the molar ratio of the isocyanate functionality to the moles of lithium cation (-NCO/Li) may be from about 50:1 to about 10:1, in other embodiments from about 10:1 to about 5:1, and in other embodiments from 5:1 to about 1:1.

[00118] The amount of the polyol that can be added to the polymerization mixture containing the intermediate polymer product may depend on various factors including the type of polyol and/or polyisocyanate and the desired degree of coupling.

[00119] In one or more embodiments, where the reactive polymer is prepared by employing a lanthanide-based catalyst, the amount of the polyol employed can be described with reference to the moles of hydroxyl functionality of the polyol (*i.e.*, -OH, which may also be referred to as the equivalents of the hydroxyl groups) and the moles of lanthanide metal associated with the lanthanide-containing compound (*i.e.* Ln). For example, the molar ratio of the hydroxyl functionality to the lanthanide metal (-OH/Ln) may be from about 1000:1 to about 500:1, in other embodiments from about 500:1 to about 100:1, and in other embodiments from about 100:1 to about 1:1.

[00120] In other embodiments, such as where the reactive polymer is prepared by using an anionic initiator, the amount of the polyol employed can be described with reference to moles of hydroxyl functionality of the polyol (*i.e.* -OH) and the moles of metal cation (*e.g.* Li) associated with the initiator. For example, where an organolithium initiator is employed, the ratio of the functionality of the polyol to the lithium cation (-OH/Li) may be from about 50:1 to about 10:1, in other embodiments from about 10:1 to about 5:1, and in other embodiments from 5:1 to about 1:1.

OPTIONAL FUNCTIONALIZING REACTION

[00121] In one or more embodiments, in addition to the coupling reaction that involves the polyisocyanate and the polyol, a functionalizing agent may also be added to the polymerization mixture to functionalize some of the polymer chains. A mixture of two or more functionalizing agents may also be employed. The functionalizing agent may be added to the polymerization mixture prior to, together with, or after the introduction of the polyisocyanate and polyol. In one or more embodiments, the functionalizing agent is added to the polymerization mixture at least 5 minutes prior to, in other embodiments at least 10 minutes prior to, and in other embodiments at least 30 minutes prior to the introduction of polyisocyanate and polyol. In other embodiments, the functionalizing agent is added to the polymerization mixture at least 5 minutes after, in other embodiments at least 10 minutes after, and in other embodiments at least 30 minutes after the introduction of polyisocyanate and polyol.

[00122] In one or more embodiments, functionalizing agents include compounds or reagents that can react with a reactive polymer produced by this invention and thereby provide the polymer with a functional group that is distinct from a propagating chain that has not been reacted with the functionalizing agent. The functional group may be reactive or interactive with other polymer chains (propagating and/or non-propagating) or with other constituents such as reinforcing fillers (e.g. carbon black) that may be combined with the polymer. In one or more embodiments, the reaction between the functionalizing agent and the reactive polymer proceeds via an addition or substitution reaction.

[00123] Useful functionalizing agents may include compounds that simply provide a functional group at the end of a polymer chain. In one or more embodiments, functionalizing agents include compounds that will add or impart a heteroatom to the polymer chain. In particular embodiments, functionalizing agents include those compounds that will impart a functional group to the polymer chain to form a functionalized polymer that reduces the 50°C hysteresis loss of a carbon-black filled vulcanizates prepared from the functionalized polymer as compared to similar carbon-black filled vulcanizates prepared from non-functionalized polymer. In one or more

embodiments, this reduction in hysteresis loss is at least 5%, in other embodiments at least 10%, and in other embodiments at least 15%.

CO-COUPLING REAGENTS

[00124] In other embodiments, an additional coupling agent may be used in combination with the polyisocyanate and polyol. These compounds, which may be referred to as co-coupling agents, may join two or more polymer chains together to form a single macromolecule. Because certain functionalizing agents may serve to couple polymer chains in addition to providing the polymer chain with a useful functionality, the co-coupling agents may simply be referred to as functionalizing agents herein.

[00125] In one or more embodiments, suitable functionalizing agents include those compounds that contain groups that may react with the reactive polymers produced in accordance with this invention. Exemplary functionalizing agents include ketones, quinones, aldehydes, amides, esters, isocyanates, isothiocyanates, epoxides, imines, aminoketones, aminothioketones, and acid anhydrides. Examples of these compounds are disclosed in U.S. Pat. Nos. 4,906,706, 4,990,573, 5,064,910, 5,567,784, 5,844,050, 6,838,526, 6,977,281, and 6,992,147; U.S. Pat. Publication Nos. 2006/0004131 A1, 2006/0025539 A1, 2006/0030677 A1, and 2004/0147694 A1; Japanese Patent Application Nos. 05-051406A, 05-059103A, 10-306113A, and 11-035633A; which are incorporated herein by reference. Other examples of functionalizing agents include azine compounds as described in U.S. Serial No. 11/640,711, hydrobenzamide compounds as disclosed in U.S. Serial No. 11/710,713, nitro compounds as disclosed in U.S. Serial No. 11/710,845, and protected oxime compounds as disclosed in U.S. Serial No. 60/875,484, all of which are incorporated herein by reference.

[00126] In particular embodiments, the functionalizing agents employed may be metal halides, metalloid halides, alkoxysilanes, metal carboxylates, hydrocarbylmetal carboxylates, hydrocarbylmetal ester-carboxylates, and metal alkoxides.

[00127] Exemplary metal halide compounds include tin tetrachloride, tin tetrabromide, tin tetraiodide, n-butyltin trichloride, phenyltin trichloride, di-n-butyltin

dichloride, diphenyltin dichloride, tri-n-butyltin chloride, triphenyltin chloride, germanium tetrachloride, germanium tetrabromide, germanium tetraiodide, n-butylgermanium trichloride, di-n-butylgermanium dichloride, and tri-n-butylgermanium chloride.

[00128] Exemplary metalloid halide compounds include silicon tetrachloride, silicon tetrabromide, silicon tetraiodide, methyltrichlorosilane, phenyltrichlorosilane, dimethyldichlorosilane, diphenyldichlorosilane, boron trichloride, boron tribromide, boron triiodide, phosphorous trichloride, phosphorous tribromide, and phosphorus triiodide.

[00129] In one or more embodiments, the alkoxysilanes may include at least one group selected from the group consisting of an epoxy group and an isocyanate group.

[00130] Exemplary alkoxysilane compounds including an epoxy group include (3-glycidyloxypropyl)trimethoxysilane, (3-glycidyloxypropyl)triethoxysilane, (3-glycidyloxypropyl)triphenoxysilane, (3-glycidyloxypropyl)methyldimethoxysilane, (3-glycidyloxypropyl)methyldiethoxysilane, (3-glycidyloxypropyl)methyldiphenoxysilane, [2-(3,4-epoxycyclohexyl)ethyl]trimethoxysilane, and [2-(3,4-epoxycyclohexyl)ethyl]triethoxysilane.

[00131] Exemplary alkoxysilane compounds including an isocyanate group include (3-isocyanatopropyl)trimethoxysilane, (3-isocyanatopropyl)triethoxysilane, (3-isocyanatopropyl)triphenoxysilane, (3-isocyanatopropyl)methyldimethoxysilane, (3-isocyanatopropyl)methyldiethoxysilane (3-isocyanatopropyl)methyldiphenoxysilane, and (isocyanatomethyl)methyldimethoxysilane.

[00132] Exemplary metal carboxylate compounds include tin tetraacetate, tin bis(2-ethylhexanoate), and tin bis(neodecanoate).

[00133] Exemplary hydrocarbylmetal carboxylate compounds include triphenyltin 2-ethylhexanoate, tri-n-butyltin 2-ethylhexanoate, tri-n-butyltin neodecanoate, triisobutyltin 2-ethylhexanoate, diphenyltin bis(2-ethylhexanoate), di-n-butyltin bis(2-

ethylhexanoate), di-n-butyltin bis(neodecanoate), phenyltin tris(2-ethylhexanoate), and n-butyltin tris(2-ethylhexanoate).

[00134] Exemplary hydrocarbylmethyl ester-carboxylate compounds include di-n-butyltin bis(n-octylmaleate), di-n-octyltin bis(n-octylmaleate), diphenyltin bis(n-octylmaleate), di-n-butyltin bis(2-ethylhexylmaleate), di-n-octyltin bis(2-ethylhexylmaleate), and diphenyltin bis(2-ethylhexylmaleate).

[00135] Exemplary metal alkoxide compounds include dimethoxytin, diethoxytin, tetraethoxytin, tetra-n-propoxytin, tetraisopropoxytin, tetra-n-butoxytin, tetraisobutoxytin, tetra-t-butoxytin, and tetraphenoxystannane.

[00136] The amount of the functionalizing agent that can be added to the polymerization mixture may depend on various factors including the type and amount of catalyst or initiator used to synthesize the reactive polymer and the desired degree of functionalization. In one or more embodiments, where the reactive polymer is prepared by employing a lanthanide-based catalyst, the amount of the functionalizing agent employed can be described with reference to the lanthanide metal of the lanthanide-containing compound. For example, the molar ratio of the functionalizing agent to the lanthanide metal may be from about 1:1 to about 200:1, in other embodiments from about 5:1 to about 150:1, and in other embodiments from about 10:1 to about 100:1.

[00137] In other embodiments, such as where the reactive polymer is prepared by using an anionic initiator, the amount of the functionalizing agent employed can be described with reference to the amount of metal cation associated with the initiator. For example, where an organolithium initiator is employed, the molar ratio of the functionalizing agent to the lithium cation may be from about 0.3:1 to about 2:1, in other embodiments from about 0.6:1 to about 1.5:1, and in other embodiments from 0.8:1 to about 1.2:1.

[00138] The amount of the functionalizing agent employed can also be described with reference to the polyisocyanate and polyol. In one or more embodiments, the molar ratio of the functionalizing agent to the polyisocyanate and polyol may be from

about 0.1:1 to about 10:1, in other embodiments from about 0.2:1 to about 5:1, and in other embodiments from about 0.5:1 to about 2:1.

COUPLING REACTION

[00139] In one or more embodiments, the polyisocyanate and polyol (and optionally the functionalizing agent) may be introduced to the polymerization mixture at a location (e.g., within a vessel) where the polymerization has been conducted. In other embodiments, the polyisocyanate and polyol may be introduced to the polymerization mixture at a location that is distinct from where the polymerization has taken place. For example, the polyisocyanate and polyol may be introduced to the polymerization mixture in downstream vessels including downstream reactors or tanks, in-line reactors or mixers, extruders, or devolatilizers. And, the polyisocyanate and the polyol can be introduced at separate locations.

[00140] In one or more embodiments, the polyisocyanate (and optionally the functionalizing agent) can be introduced to the polymerization mixture after a desired monomer conversion is achieved but before the polymerization mixture is quenched by a quenching agent. In one or more embodiments, the introduction of the polyisocyanate to the reactive polymer may take place within 30 minutes, in other embodiments within 5 minutes, and in other embodiments within one minute after the peak polymerization temperature is reached. In one or more embodiments, the introduction of the polyisocyanate to the reactive polymer can occur once the peak polymerization temperature is reached. In other embodiments, the introduction of the polyisocyanate to the reactive polymer can occur after the reactive polymer has been stored. In one or more embodiments, the storage of the reactive polymer occurs at room temperature or below room temperature under an inert atmosphere.

[00141] In one or more embodiments, the introduction of the polyisocyanate to the reactive polymer may take place at a temperature from about 10 °C to about 150 °C, and in other embodiments from about 20 °C to about 100 °C. The time required for completing the reaction between the polyisocyanate and the reactive polymer depends on various factors such as the type and amount of the catalyst or initiator used to prepare the reactive polymer, the type and amount of the polyisocyanate, as well as

the temperature at which the reaction is conducted. In one or more embodiments, the reaction between the polyisocyanate and the reactive polymer can be conducted for about 1 to 60 minutes, in other embodiments for about 1 to 30 minutes, and in other embodiments for about 1 to 5 minutes.

[00142] Once a desired amount of time is provided for the polyisocyanate to react with the reactive polymer, the polyol can be introduced to the polymerization mixture, which now includes the intermediate polymer product. As those skilled in the art will appreciate, the polyol is added prior to the introduction of a quenching agent other than the polyol intended for use in the sequential coupling reaction.

[00143] In one or more embodiments, the introduction of the polyol to the polymerization mixture takes place after 300 minutes, in other embodiments after 150 minutes, and in other embodiments after 60 minutes from the introduction of the polyisocyanate to the polymerization mixture. In these or other embodiments, the introduction of the polyol to the polymerization mixture takes place within 30 minutes, in other embodiments within 15 minutes, and in other embodiments within 5 minutes from the introduction of the polyisocyanate to the polymerization mixture.

[00144] In one or more embodiments, the introduction of the polyol to the polymerization mixture containing the intermediate polymer product may take place at a temperature from about 10 °C to about 150 °C, and in other embodiments from about 20 °C to about 100 °C. The time required for completing the reaction between the polyol and the intermediate polymer product depends on various factors such as the type and amount of the polyisocyanate and polyol, as well as the temperature at which the reaction is conducted. In one or more embodiments, the reaction between the polyol and the intermediate polymer product can be conducted for about 300 to 60 minutes, in other embodiments for about 60 to 30 minutes, and in other embodiments for about 30 to 1 minutes.

QUENCHING

[00145] In one or more embodiments, after the reaction between the reactive polymer and the polyisocyanate and polyol (and optionally the functionalizing agent) has been accomplished or completed, a quenching agent can be optionally added to

the polymerization mixture in order to protonate and/or inactivate any residual reactive polymer chains, and/or inactivate the catalyst or catalyst components. The quenching agent may include a protic compound, which includes, but is not limited to, an alcohol, a carboxylic acid, an inorganic acid, water, or a mixture thereof. In particular embodiments, the process is devoid of using a quenching agent other than the polyol used in the coupling reaction. An antioxidant such as 2,6-di-tert-butyl-4-methylphenol may be added along with, before, or after the addition of the quenching agent. The amount of the antioxidant employed may be in the range of 0.2% to 1% by weight of the polymer product. Additionally, the polymer product can be oil extended by adding an oil to the polymer, which may be in the form of a polymer cement or polymer dissolved or suspended in monomer. Practice of the present invention does not limit the amount of oil that may be added, and therefore conventional amounts may be added (e.g., 5-50 phr). Useful oils or extenders that may be employed include, but are not limited to, aromatic oils, paraffinic oils, naphthenic oils, vegetable oils other than castor oils, low PCA oils including MES, TDAE, and SRAE, and heavy naphthenic oils.

POLYMER RECOVERY

[00146] Once the coupling reaction has been completed by providing a desired time for the **polyol** to react with the intermediate polymer product, and/or any subsequent additions (e.g., oil) are introduced to the polymerization mixture, the various constituents of the polymerization mixture may be recovered. In one or more embodiments, the unreacted monomer can be recovered from the polymerization mixture. For example, the monomer can be distilled from the polymerization mixture by using techniques known in the art. In one or more embodiments, a devolatilizer may be employed to remove the monomer from the polymerization mixture. Once the monomer has been removed from the polymerization mixture, the monomer may be purified, stored, and/or recycled back to the polymerization process.

[00147] The polymer product may be recovered from the polymerization mixture by using techniques known in the art. In one or more embodiments, desolventization and drying techniques may be used. For instance, the polymer can be recovered by

passing the polymerization mixture through a heated screw apparatus, such as a desolventizing extruder, in which the volatile substances are removed by evaporation at appropriate temperatures (*e.g.*, about 100°C to about 170°C) and under atmospheric or sub-atmospheric pressure. This treatment serves to remove unreacted monomer as well as any low-boiling solvent. Alternatively, the polymer can also be recovered by subjecting the polymerization mixture to steam desolventization, followed by drying the resulting polymer crumbs in a hot air tunnel. The polymer can also be recovered by directly drying the polymerization mixture on a drum dryer.

POLYMER PRODUCT

[00148] The reactive polymer and the polyisocyanate (and optionally the functionalizing agent) are believed to react to produce the intermediate polymer product, which is believed to include at least one isocyanate end functionality. Specifically, it is believed that the living polymer adds to a first isocyanate functionality of the polyisocyanate via a nucleophilic addition reaction, thereby imparting the residue of the polyisocyanate to the end of the polymeric chain. The residue of the polyisocyanate includes at least one isocyanate functionality that can subsequently react with the polyol. Thus, the introduction of the polyol to the polymerization mixture including the intermediate polymer product is believed to lead to a reaction with at least one isocyanate functionality to produce the coupled polymer product. Specifically, the polyol is believed to react with the isocyanate in a polyurethane-type reaction that produces a carbamate linkage between the polyisocyanate residue and the polyol residue.

[00149] Nonetheless, the exact chemical structure of the coupled polymer produced in every embodiment is not known with any great degree of certainty, particularly as the structure relates to the residue imparted to the polymer chain end by the polyisocyanate and/or polyol and optionally the functionalizing agent. Indeed, it is speculated that the structure of the coupled polymer may depend upon various factors such as the conditions employed to prepare the reactive polymer (*e.g.*, the type and amount of the catalyst or initiator) and the conditions employed to react the polyisocyanate and/or polyol (and optionally the functionalizing agent) with the

reactive polymer (e.g., the types and amounts of the polyisocyanate and polyol and the functionalizing agent).

[00150] In one or more embodiments, particularly where a diisocyanate is employed to form the intermediate polymer product, and a triol is employed to couple the intermediate polymer product, one of the coupled polymers may be defined by the formula

where R^{10} is a multivalent organic group deriving from the triol, R^{11} is a divalent organic group deriving from the diisocyanate, and each R^{12} is a polymer chain.

[00151] In one or more embodiments, the coupled polymers prepared according to this invention may contain unsaturation. In these or other embodiments, the coupled polymers are vulcanizable. In one or more embodiments, the coupled polymers can have a glass transition temperature (T_g) that is less than 0 °C, in other embodiments less than -20 °C, and in other embodiments less than -30 °C. In one embodiment, these polymers may exhibit a single glass transition temperature. In particular embodiments, the polymers may be hydrogenated or partially hydrogenated.

[00152] In one or more embodiments, the coupled polymers of this invention may be cis-1,4-polydienes having a cis-1,4-linkage content that is greater than 60%, in other embodiments greater than about 75%, in other embodiments greater than about 90%, and in other embodiments greater than about 95%, where the percentages are based upon the number of diene *mer* units adopting the cis-1,4 linkage versus the total number of diene *mer* units. Also, these polymers may have a 1,2-linkage content that is less than about 7%, in other embodiments less than 5%, in other embodiments less than 2%, and in other embodiments less than 1%, where the percentages are based upon the number of diene *mer* units adopting the 1,2-linkage versus the total number of diene *mer* units. The balance of the diene *mer* units may adopt the trans-1,4-linkage. The cis-1,4-, 1,2-, and trans-1,4-linkage contents can be determined by infrared spectroscopy. The number average molecular weight (M_n) of these polymers

may be from about 1,000 to about 1,000,000, in other embodiments from about 5,000 to about 200,000, in other embodiments from about 25,000 to about 150,000, and in other embodiments from about 50,000 to about 120,000, as determined by using gel permeation chromatography (GPC) calibrated with polystyrene standards and Mark-Houwink constants for the polymer in question. The molecular weight distribution or polydispersity (M_w/M_n) of these polymers may be from about 1.5 to about 5.0, and in other embodiments from about 2.0 to about 4.0.

[00153] In one or more embodiments, the coupled polymers of this invention may be cis-1,4-polydienes having a cis-1,4-linkage content that is greater than 60%, in other embodiments greater than about 75%, in other embodiments greater than about 90%, and in other embodiments greater than about 95%, where the percentages are based upon the number of diene *mer* units adopting the cis-1,4 linkage versus the total number of diene *mer* units. Also, these polymers may have a 1,2-linkage content that is less than about 7%, in other embodiments less than 5%, in other embodiments less than 2%, and in other embodiments less than 1%, where the percentages are based upon the number of diene *mer* units adopting the 1,2-linkage versus the total number of diene *mer* units. The balance of the diene *mer* units may adopt the *trans*-1,4-linkage. The cis-1,4-, 1,2-, and *trans*-1,4-linkage contents can be determined by infrared spectroscopy. The number average molecular weight (M_n) of these polymers may be from about 1,000 to about 1,000,000, in other embodiments from about 5,000 to about 200,000, in other embodiments from about 25,000 to about 150,000, and in other embodiments from about 50,000 to about 120,000, as determined by using gel permeation chromatography (GPC) calibrated with polystyrene standards and Mark-Houwink constants for the polymer in question. The polydispersity (M_w/M_n) of these polymers may be from about 1.5 to about 5.0, and in other embodiments from about 2.0 to about 4.0.

[00154] In one or more embodiments, the coupled polymers of this invention may be polydienes or polydiene copolymers (e.g. copolymers of dienes with vinyl aromatic monomer) having medium or low cis-1,4-linkage contents. These polymers, which

can be prepared by anionic polymerization techniques, can have a cis-1,4-linkage content of from about 10% to 60%, in other embodiments from about 15% to 55%, and in other embodiments from about 20% to about 50%. These polydienes may also have a 1,2-linkage content from about 10% to about 90%, in other embodiments from about 10% to about 60%, in other embodiments from about 15% to about 50%, and in other embodiments from about 20% to about 45%. In particular embodiments, where the polydienes are prepared by employing a functional anionic initiator, the head of the polymer chains include a functional group that is the residue of the functional initiator.

[00155] In particular embodiments, the coupled polymers of this invention are copolymers of 1,3-butadiene, styrene, and optionally isoprene. These may include random copolymers and block copolymers. In one or more embodiments, the random polydiene copolymers may include from about 10 to about 50 % by weight, in other embodiments from about 15 to about 40 % by weight, and in other embodiments from about 20 to about 30 % by weight units deriving from styrene, with the balance including units deriving from conjugated diene monomer, such as 1,3-butadiene, having low or medium cis content as described above.

INDUSTRIAL APPLICABILITY

[00156] Advantageously, the coupled polymers of this invention may exhibit improved cold-flow resistance. The coupled polymers are particularly useful in preparing rubber compositions that can be used to manufacture tire components. Rubber compounding techniques and the additives employed therein are generally disclosed in *The Compounding and Vulcanization of Rubber*, in *Rubber Technology* (2nd Ed. 1973).

[00157] The rubber compositions can be prepared by using the coupled polymers alone or together with other elastomers (i.e., polymers that can be vulcanized to form compositions possessing rubbery or elastomeric properties). Other elastomers that may be used include natural and synthetic rubbers. The synthetic rubbers typically derive from the polymerization of conjugated diene monomers, the copolymerization of conjugated diene monomers with other monomers such as vinyl-substituted

aromatic monomers, or the copolymerization of ethylene with one or more α -olefins and optionally one or more diene monomers.

[00158] Exemplary elastomers include natural rubber, synthetic polyisoprene, polybutadiene, polyisobutylene-co-isoprene, neoprene, poly(ethylene-co-propylene), poly(styrene-co-butadiene), poly(styrene-co-isoprene), poly(styrene-co-isoprene-co-butadiene), poly(isoprene-co-butadiene), poly(ethylene-co-propylene-co-diene), polysulfide rubber, acrylic rubber, urethane rubber, silicone rubber, epichlorohydrin rubber, and mixtures thereof. These elastomers can have a myriad of macromolecular structures including linear, branched, and star-shaped structures.

[00159] The rubber compositions may include fillers such as inorganic and organic fillers. Examples of organic fillers include carbon black and starch. Examples of inorganic fillers include silica, aluminum hydroxide, magnesium hydroxide, mica, talc (hydrated magnesium silicate), and clays (hydrated aluminum silicates). Carbon blacks and silicas are the most common fillers used in manufacturing tires. In certain embodiments, a mixture of different fillers may be advantageously employed.

[00160] In one or more embodiments, carbon blacks include furnace blacks, channel blacks, and lamp blacks. More specific examples of carbon blacks include super abrasion furnace blacks, intermediate super abrasion furnace blacks, high abrasion furnace blacks, fast extrusion furnace blacks, fine furnace blacks, semi-reinforcing furnace blacks, medium processing channel blacks, hard processing channel blacks, conducting channel blacks, and acetylene blacks.

[00161] In particular embodiments, the carbon blacks may have a surface area (EMSA) of at least 20 m²/g and in other embodiments at least 35 m²/g; surface area values can be determined by ASTM D-1765 using the cetyltrimethylammonium bromide (CTAB) technique. The carbon blacks may be in a pelletized form or an unpelletized flocculent form. The preferred form of carbon black may depend upon the type of mixing equipment used to mix the rubber compound.

[00162] The amount of carbon black employed in the rubber compositions can be up to about 50 parts by weight per 100 parts by weight of rubber (phr), with about 5 to about 40 phr being typical.

[00163] Some commercially available silicas which may be used include Hi-Sil™ 215, Hi-Sil™ 233, and Hi-Sil™ 190 (PPG Industries, Inc.; Pittsburgh, Pa.). Other suppliers of commercially available silica include Grace Davison (Baltimore, Md.), Degussa Corp. (Parsippany, N.J.), Rhodia Silica Systems (Cranbury, N.J.), and J.M. Huber Corp. (Edison, N.J.).

[00164] In one or more embodiments, silicas may be characterized by their surface areas, which give a measure of their reinforcing character. The Brunauer, Emmet and Teller ("BET") method (described in *J. Am. Chem. Soc.*, vol. 60, p. 309 et seq.) is a recognized method for determining the surface area. The BET surface area of silica is generally less than 450 m²/g. Useful ranges of surface area include from about 32 to about 400 m²/g, about 100 to about 250 m²/g, and about 150 to about 220 m²/g.

[00165] The pH's of the silicas are generally from about 5 to about 7 or slightly over 7, or in other embodiments from about 5.5 to about 6.8.

[00166] In one or more embodiments, where silica is employed as a filler (alone or in combination with other fillers), a silica coupling agent and/or a silica shielding agent may be added to the rubber compositions during mixing in order to enhance the interaction of silica with the elastomers. Useful silica coupling agents and silica shielding agents are disclosed in U.S. Patent Nos. 3,842,111, 3,873,489, 3,978,103, 3,997,581, 4,002,594, 5,580,919, 5,583,245, 5,663,396, 5,674,932, 5,684,171, 5,684,172, 5,696,197, 6,608,145, 6,667,362, 6,579,949, 6,590,017, 6,525,118, 6,342,552, and 6,683,135, which are incorporated herein by reference.

[00167] The amount of silica employed in the rubber compositions can be from about 1 to about 100 phr or in other embodiments from about 5 to about 80 phr. The useful upper range is limited by the high viscosity imparted by silicas. When silica is used together with carbon black, the amount of silica can be decreased to as low as about 1 phr; as the amount of silica is decreased, lesser amounts of coupling agents and shielding agents can be employed. Generally, the amounts of coupling agents and shielding agents range from about 4% to about 20% based on the weight of silica used.

[00168] A multitude of rubber curing agents (also called vulcanizing agents) may be employed, including sulfur or peroxide-based curing systems. Curing agents are described in *Kirk-Othmer, ENCYCLOPEDIA OF CHEMICAL TECHNOLOGY*, Vol. 20, pgs. 365-468, (3rd Ed. 1982), particularly *Vulcanization Agents and Auxiliary Materials*, pgs. 390-402, and A.Y. Coran, *Vulcanization, ENCYCLOPEDIA OF POLYMER SCIENCE AND ENGINEERING*, (2nd Ed. 1989), which are incorporated herein by reference. Vulcanizing agents may be used alone or in combination.

[00169] Other ingredients that are typically employed in rubber compounding may also be added to the rubber compositions. These include accelerators, accelerator activators, oils, plasticizer, waxes, scorch inhibiting agents, processing aids, zinc oxide, tackifying resins, reinforcing resins, fatty acids such as stearic acid, peptizers, and antidegradants such as antioxidants and antiozonants. In particular embodiments, the oils that are employed include those conventionally used as extender oils, which are described above.

[00170] All ingredients of the rubber compositions can be mixed with standard mixing equipment such as Banbury or Brabender mixers, extruders, kneaders, and two-rolled mills. In one or more embodiments, the ingredients are mixed in two or more stages. In the first stage (often referred to as the masterbatch mixing stage), a so-called masterbatch, which typically includes the rubber component and filler, is prepared. To prevent premature vulcanization (also known as scorch), the masterbatch may exclude vulcanizing agents. The masterbatch may be mixed at a starting temperature of from about 25 °C to about 125 °C with a discharge temperature of about 135 °C to about 180 °C. Once the masterbatch is prepared, the vulcanizing agents may be introduced and mixed into the masterbatch in a final mixing stage, which is typically conducted at relatively low temperatures so as to reduce the chances of premature vulcanization. Optionally, additional mixing stages, sometimes called remills, can be employed between the masterbatch mixing stage and the final mixing stage. One or more remill stages are often employed where the rubber composition includes silica as the filler. Various ingredients including the coupled polymers of this invention can be added during these remills.

[00171] The mixing procedures and conditions particularly applicable to silica-filled tire formulations are described in U.S. Patent Nos. 5,227,425, 5,719,207, and 5,717,022, as well as European Patent No. 890,606, all of which are incorporated herein by reference. In one embodiment, the initial masterbatch is prepared by including the coupled polymers of this invention and silica in the substantial absence of silica coupling agents and silica shielding agents.

[00172] The rubber compositions prepared from the coupled polymers of this invention are particularly useful for forming tire components such as treads, subreads, sidewalls, body ply skims, bead filler, and the like. Preferably, the coupled polymers of this invention are employed in tread and sidewall formulations. In one or more embodiments, these tread or sidewall formulations may include from about 10% to about 100% by weight, in other embodiments from about 35% to about 90% by weight, and in other embodiments from about 50% to about 80% by weight of the coupled polymer based on the total weight of the rubber within the formulation.

[00173] Where the rubber compositions are employed in the manufacture of tires, these compositions can be processed into tire components according to ordinary tire manufacturing techniques including standard rubber shaping, molding and curing techniques. Typically, vulcanization is effected by heating the vulcanizable composition in a mold; *e.g.*, it may be heated to about 140 °C to about 180 °C. Cured or crosslinked rubber compositions may be referred to as vulcanizates, which generally contain three-dimensional polymeric networks that are thermoset. The other ingredients, such as fillers and processing aids, may be evenly dispersed throughout the crosslinked network. Pneumatic tires can be made as discussed in U.S. Patent Nos. 5,866,171, 5,876,527, 5,931,211, and 5,971,046, which are incorporated herein by reference.

[00174] In order to demonstrate the practice of the present invention, the following examples have been prepared and tested. The examples should not, however, be viewed as limiting the scope of the invention. The claims will serve to define the invention.

EXAMPLES

[00175] Hexane, butadiene, and styrene were purified by distillation and dried using a Lector dryer prior to use. All other compounds were used as purchased. The polymerization reactor consisted of a 25-gallon stainless cylinder equipped with a mechanical agitator (shaft and blades) capable of mixing high viscosity polymer cement. The polymerization reactor was equipped with a jacket containing water used to control the temperature of the polymerization solution.

[00176] The Mooney viscosities (ML_{1+4}) of the polymer samples were determined at 100 °C by using a Monsanto Mooney viscometer with a large rotor, a one-minute warm-up time, and a four-minute running time. The number average (M_n) and weight average (M_w) molecular weights of the polymer samples were determined by gel permeation chromatography (GPC). The microstructure of the polymers was determined by 1H NMR spectroscopy using $CDCl_3$ as a solvent.

[00177] Several methods were used to measure cold flow resistance. First, using a Scott Tester, a cylinder-shaped polymer sample with a diameter of 40 mm and a height of 13.0 mm was placed on its cylindrical base and a 5000 g mass was placed on top of the cylinder for 30 minutes at which time the height of the cylinder was measure. Second, gravity cold flow tests were conducted by preparing a cylinder-shaped polymer sample with a diameter of 10 mm and a height of 12.5 mm. The cylinder was placed on its circular base and left in place for 28 days at which time the height of the cylinder was measured. Third, to simulate storage of a stack of polymers on top of the polymer sample, the experiment was repeated with a weight equal to the weight of 7 polymer cylinders placed on the cylinder-shaped polymer sample for 28 days.

[00178] For compounding studies, the carbon black-filled formulations were similar to those conventionally employed for making tire treads. The rubber formulations were sheeted and cured according to conventional techniques. The Mooney viscosity (ML_{1+4}) of the uncured compound was determined at 130 °C by using a Alpha Technologies Mooney viscometer with a large rotor, a one-minute warm-up time, and

a four minute running time. The tensile at break (T_b), and the elongation at break (E_b) were determined according to ASTM D412. The Payne effect data ($\Delta G'$) and hysteresis data ($\tan \delta$) of the vulcanizates were obtained from a dynamic strain sweep experiment, which was conducted at 50 °C and 15 Hz with strain sweeping from 0.1% to 14.25%. $\Delta G'$ is the difference between G' at 0.1% strain and G' at 14.25% strain.

[00179] Bound rubber, a measure of the percentage of rubber bound, through some interaction, to the filler, was determined by solvent extraction with toluene at room temperature. More specifically, a test specimen of each uncured rubber formulation was placed in toluene for three days. The solvent was removed and the residue was dried and weighed. The percentage of bound rubber was then determined according to the formula:

$$\% \text{ bound rubber} = (100(W_d - F))/R$$

where W_d is the weight of the dried residue, F is the weight of the filler and any other solvent insoluble matter in the original sample, and R is the weight of the rubber in the original sample.

[00180] The reactor was thoroughly purged with a stream of dry nitrogen, which was then replaced with 4.82 kg of hexane, 1.56 kg of a 34.0% styrene in hexane solution, and 4.94 kg of 21.2% butadiene in hexane solution. After the monomer solution was thermostated at 23°C, the polymerization was initiated by charging 10.9 mL of 1.6 M *n*-butyl lithium (BuLi) in hexane, 4.94 mL of 3.0 M hexamethyleneimine in hexane, 1.31 mL of 1.6 M 2,2-di(2-tetrahydrofuryl)propane in hexane, and 0.96 mL of 1.0 M potassium 2-methyl-2-butanolate in hexane into the reactor. The reactor was heated until the polymerization temperature reached 60°C at which cooling water at a temperature of 32°C was applied. When the polymerization temperature reached 62°C, the temperature of the cooling water was lowered to 21°C while the polymerization temperature continued to rise to 89°C. Ten minutes after the peak exotherm was achieved, the polymer cement was dropped into large, sealed bottles that had been purged with nitrogen. The polymer cement was then functionalized with tin tetrachloride or a combination of tolyl-2,4-diisocyanate and glycerol as set

forth in Table 1. Specifically, polymer samples 1, 3, and 4, were treated with the diisocyanate and shaken vigorously for 5 minutes at 50°C. Then, glycerol was added to the polymer cement and the solution was shaken for 30 minutes at 50°C. The amount of glycerol added after diisocyanate addition was the minimum amount of hydroxyls needed to react with all remaining isocyanate functional groups. For polymer 2, the polymer cement was treated with tin tetrachloride (SnCl_4) and was agitated for 30 minutes at 50°C. After functionalization was complete in polymer samples 1, 2, 3, and 4, the polymer cement was treated with 3.0 mL of a 0.5 M 2,6-di-tert-butyl-4-methylphenol (BHT) in isopropanol. The polymers were isolated from the cements by coagulation in BHT-saturated isopropanol followed by solvent removal via drum drying. Table 1 also provides the characteristics of each of the functionalized polymers.

Table 1

[00181] The cold flow resistance of each polymer in Table 1 was measured and is reported in Table 2. Polymers 3 and 4, which were coupled with diisocyanate and

glycerol, were much more resistant to cold flow than uncoupled Polymer 1 and had similar cold flow properties as Polymer 2, which was coupled with SnCl_4 .

Table 2

Bound Rubber (%)	30.09	41.65	39.06	42.93
* The amount of glycerol added after diisocyanate addition was the minimal amount needed to react with all remaining isocyanate functional groups.				

[00184] Polymers 3 and 4, which were coupled with diisocyanates and glycerol, had similar compound Mooney (ML₁₊₄ @130 °C) as Polymer 2, which was coupled with SnCl₄, and all polymers were readily processed during mixing. When compared to Polymer 2, Polymers 3 and 4 have similar cure times, modulus values, tensile break stresses, and elongation at breaks. The various methods used to measure hysteresis (tan δ) showed a desirable reduction in hysteresis when comparing Polymers 3 and 4 against uncoupled Polymer 1. Likewise, this desirable reduction in hysteresis is similar to Polymer 2. In conclusion, polymers coupled with diisocyanate and glycerol had similar compounded properties to polymers coupled with tin-coupling reagents.

[00185] Various modifications and alterations that do not depart from the scope and spirit of this invention will become apparent to those skilled in the art. This invention is not to be duly limited to the illustrative embodiments set forth herein.

CLAIMS

What is claimed is:

1. A method for preparing a coupled polymer, the method comprising the steps of:
 - (i) polymerizing monomer to form a reactive polymer;
 - (ii) reacting the reactive polymer with a polyisocyanate having a functionality of X to form an intermediate polymer product; and
 - (iii) reacting the intermediate polymer product with a polyol having a functionality of Y to form the coupled polymer product, where $X+Y \geq 5$.
2. The method of any of the preceding claims, where $X \geq 2$ and $Y \geq 2$.
3. The method of any of the preceding claims, where the polyisocyanate is a diisocyanate or triisocyanate.
4. The method of any of the preceding claims, where the polyisocyanate is a diisocyanato hydrocarbyl and the polyol is a triol or a polyol having four or more hydroxyl groups.
5. The method of any of the preceding claims, where the polyisocyanate is a triisocyanato hydrocarbyl and the polyol is a diol, triol, or polyol having four or more hydroxyl groups.
6. The method of any of the preceding claims, where the polyisocyanate is a diisocyanato hydrocarbyl selected from the group consisting of diisocyanatoalkyls, diisocyanatocycloalkyls, diisocyanatoaryls, diisocyanatoalkenyls, and diisocyanatoalkynyls.
7. The method of any of the preceding claims, where the polyisocyanate is selected from the group consisting of methylene diphenyl diisocyanate, toluene diisocyanate,

hexamethylene diisocyanate, isophonone diisocyanate, and 4,4'-methylenebis(cyclohexyl isocyanate).

8. The method of any of the preceding claims, where polyol is a diol selected from the group consisting of alkyldiols, cycloalkyldiols, aryl diols, alkenyldiols, and alkynyldiols.

9. The method of any of the preceding claims, where polyol is a triol selected from the group consisting of alkyltriols, cycloalkyltriols, aryltriols, alkenyltriols, and alkynyltriols.

10. The method of any of the preceding claims, where the polyol is glycerol.

11. The method of any of the preceding claims, where the said step of polymerizing monomer includes polymerizing conjugated diene monomer and monomer copolymerizable therewith.

12. The method of any of the preceding claims, where said step of polymerizing takes place using anionic polymerization techniques.

13. The method of claim 7, where said step of polymerizing takes place using an organolithium initiator.

14. The method of claim 13, where said step of polymerizing takes place using a coordination catalyst system.

15. A method for preparing a coupled polymer, the method comprising the steps of:

(i) polymerizing conjugated diene monomer, and optionally monomer copolymerizable therewith, to form polymer having a reactive chain end;

(ii) reacting the reactive chain end of the polymer with a polyisocyanate having a functionality of X to form an intermediate polymer product; and

(iii) reacting the intermediate polymer product with a polyol having a functionality of Y to form the coupled polymer product, where $X+Y \geq 5$.

16. A coupled polymer defined by the formula:

where R^{10} is a multivalent organic group deriving from the triol, R^{11} is a divalent organic group deriving from the diisocyanate, and each R^{12} is a polymer chain.

17. The coupled polymer of claim 16, where R^{12} is a polydiene having a cis-1,4-linkage content that is greater than 60%.

18. The coupled polymer of claim 18, where R^{12} is a polydiene or polydiene copolymer having a cis-1,4-linkage content of from about 10% to 60%.

19. A tire component prepared from the coupled polymer of any of the preceding claims.
