

ABSTRACT

SYSTEM AND METHOD FOR QUIZ GENERATION

Disclosed is a system (100) and method (300) for quiz generation. The system (100) is further configured to evaluate a set of question-answer pairs and generate grades. The system (100) includes a database (122) and a processing circuitry (120). The database (122) is configured to store a first set of documents and a second set of question-answer pairs. The processing circuitry (120) is configured to generate a first set of keywords and the first set of question-answer pairs from a first text and a second set of keywords from the second set of question-answer pairs. Furthermore, the processing circuitry (120) is configured to match the second set of keywords with the first set of keywords and select a number of question-answer pairs from the first set of question-answer pairs based on the matching of the second set of keywords with the first set of keywords to generate quiz data.
