

【ABSTRACT】

The present disclosure relates to a parenteral composition which maintains the effect of a filler for a long period of time by containing collagen hydrolysate as an active ingredient. Since the composition according to the present disclosure can maintain the effect of a hyaluronic acid filler for a longer period of time, the effect of the filler can be maintained even with a smaller number of filler treatment and skin irritation can also be reduced. In addition, since the composition can be directly injected into the skin by simple parenteral administration, an immediate effect can be achieved.
