

Abstract

Unlock device and stroller

An unlock device includes at least one operating member, at least one unlock module, and a selecting member. The at least one operating member is movably disposed on a frame, wherein the frame is equipped with at least one lock mechanism. The at least one unlock module is movably disposed on the frame and connected to the at least one lock mechanism. The at least one unlock module includes at least one sliding member slidably disposed on the frame. The at least one operating member moves to drive the at least one unlock module to move to unlock the at least one lock mechanism. The selecting member is movably disposed on the frame and selectively abuts against the at least one sliding member to control unlock operation of the at least one unlock module.
