

ABSTRACT

This application relates to a method for transmitting a physical layer protocol data unit and a communication apparatus. According to this application, a first device generates a PPDU. The PPDU includes first information carried in a first subcarrier set. The first information includes data
5 information and pilot information. The first subcarrier set includes at least one first RU and/or at least one first MRU. The data information is carried on a data subcarrier corresponding to the at least one first RU and/or a data subcarrier corresponding to at least one MRU. The pilot information includes first pilot information carried on a first pilot subcarrier corresponding to the at least one first RU and/or a first pilot subcarrier corresponding to the at least one MRU. This
10 helps increase a number of pilot subcarriers.
