

Abstract

The invention relates to a barrier (31) to protect users from falling out of a transport device (1) that is configured as an escalator or moving walkway. The barrier (31) is configured to be installed on the transport device (1) next to a circulating, movable handrail (15) of a balustrade (9) of the transport device (1). In an installed state, the barrier (31) extends parallel to the handrail (15) and projects at a height (HA) beyond the balustrade (9) or the handrail (15). The barrier (31) moreover has a deflector (29) and a panel region (22), with at least one barrier panel (45, 45A), adjoining this deflector (29).
