What is claimed is:

1. A refrigerator-freezer comprising:

a plurality of divided storage compartments;

a cooler configured to cool ambient air and generate cold air supplied to the storage compartments;

an air duct configured to cause the cold air generated by the cooler to flow into the storage compartments;

air-volume adjusting units configured to respectively adjust inflows of the cold air from the air duct into the storage compartments;

temperature detecting units configured to respectively detect temperatures of the storage compartments;

a cooling-stop setting unit~~s~~ capable of individually setting stop of cooling control for the storage compartments; and

a control unit configured to stop, concerning the storage compartment for which the cooling control is set to be stopped by the cooling-stop setting unit, inflow of the cold air into the storage compartment using the air-volume adjusting unit and stop the cooling control and, when the temperature detecting unit continuously detects, for a fixed time or more, abnormal temperature equal to or higher than first temperature set in advance, even during the setting for stopping the cooling control, release the control for stopping the inflow of the cold air into the
