

ABSTRACT

Embodiments of the specification disclose a transaction execution method, apparatus, and device applicable in a client terminal and a server. The transaction execution method includes: scanning, by a client terminal, an offline object and a corresponding identification code thereof, the identification code including positioning assistance information of the offline object; triggering an recognition process for the offline object and the identification code that are scanned; and executing a transaction with respect to the offline object based on the recognition process. In addition, a server can also help the client terminal to execute transaction with respect to the offline object.
