

INFORMATION TRANSMISSION METHOD, TERMINAL DEVICE AND NETWORK DEVICE

ABSTRACT

The embodiments of the present disclosure provides a method for transmitting information, a terminal device and a network device, which can improve the flexibility of transmitting downlink control information, and can better adapt to the requirement of flexibly configuring the first resource area in a large broadband system. It can improve system efficiency and reduce system interference. The method includes: the terminal device receiving first indication information sent by the network device; the terminal device receiving, according to the first indication information, first downlink control information sent by the network device.
