ABSTRACT

An adjusted image data generating device (10) includes storage (18) and an  
adjusting section (14). The storage (18) stores color reference data (RD) of a color  
reference (30) therein. The adjusting section (14) generates adjusted image data (CD)  
10 by adjusting an object image (Tg) for image data (G) representing a color reference  
image (30g) and the object image (Tg) so that color data of a color reference image  
(30g) matches the color reference data (RD). The color reference image (30g) is an  
image of a color reference (30). The image data (G) is an image of an object (T).
