ABSTRACT

APPARATUS AND METHODS FOR UPDATING FIRMWARE

A method for updating firmware comprises executing a native operating system change management program that acts cooperatively with a firmware update package to update a firmware program in the information handling system. An apparatus comprises an information handling system running an operating system. An operating system change management program in a memory of the information handling system acts cooperatively with the operating system and a firmware update package to update a firmware program in the information handling system. Another method for updating firmware comprises building a firmware update package that is executable in a change management program running in a native operating system on an information handling system, and storing the firmware update package in a repository available to a user.
