(54) Title: FLOOR MAT

(57) Abstract

There is provided a mat having multiple sets of pins, each set of pins being located within a surrounding, characterised in that the pins do not extend significantly beyond the highest point of the surrounding. Thus the pins are protected by the surrounding and are less likely to break after extended use. The mat may be provided with areas adapted for the receipt of strips of textile materials, e.g. carpeting which advantageously has a hard–backing and is able to snap into the areas provided. The inclusion of the textile material combines a scraping function together with the visual appearance of a carpet. The strips of textile material will be separated by sets of pins as described above. A set of such mats is also described.
