System and Method for Validating and Measuring
Effectiveness of Information Security Programs

Abstract of Invention

A system and method for validating and measuring the effectiveness of information security programs and services provides an automated tool set for inputting and transmitting security measurements that enables a standard metric relating to specific information security programs, utilizing system software and a graphical user interface that works in conjunction with the system software to input data and to provide the user with reports. The user is provided with a snapshot view or status of the information security of an organization, for example, by business group, as well as reports on local business, country, and group levels.
