OFFLINE PAYMENT

ABSTRACT

According to an offline payment method and system provided in this specification, a payee terminal can synchronously transmit transaction information to a payer terminal in real time by using a target optical signal, to synchronously transmit the transaction information between the payer terminal and the payee terminal in real time during offline payment. In addition, according to the offline payment method and system provided in this specification, bidirectional verification can be implemented on the payer terminal and the payee terminal, to improve security of offline payment.
